D.S.A · C++

Transistor :- 0 or 1
off on

Binary no - $\{0, 1\}_{base=2}$

0 + 0 = 1

1 + 0 = 1

0 + 1 = 1

1 + 1 = 1 0 (Carry, Base)

Conversion :-

$(27)_{10} \rightarrow (\ ?\ )_2$

2	27	1
2	13	1
2	6	0
2	3	1
	1	

Quotient, Remender

$\Rightarrow (11011)_2$

2	43	1
2	21	1
2	10	0
2	5	1
2	2	0
	1	

$\Rightarrow (101011)_{10} \rightarrow (43)_{10}$

---

(4) Decimal → other ⇒ Divide with base.

(5) other → Decimal ⇒ Multiply with (base)^n n=0,1,2

other

octal ⟷ binary

0	000
1	001
2	010
3	011

Moore law : Every 2 year transistor double

Machine language → binary

Assembler Compiler Interpreter

Data = Store / Fetch.

↳ Space ↓

↳ Time ↓

Flowchart & Pseudocode

Diagram representation Instructions

① Understand
② Given value
③ Approach
④ Code
⑤ Error / debug
⑥ Other Solution

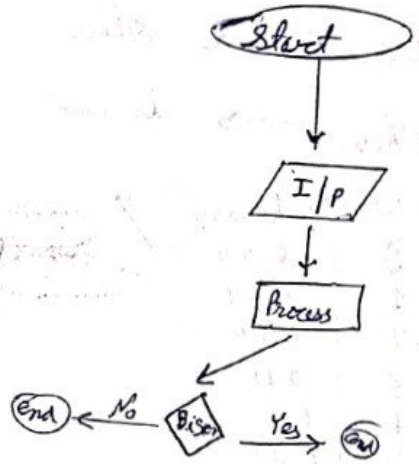
① Terminal (Start, End).

② Parallelogram (I/P, O/P)

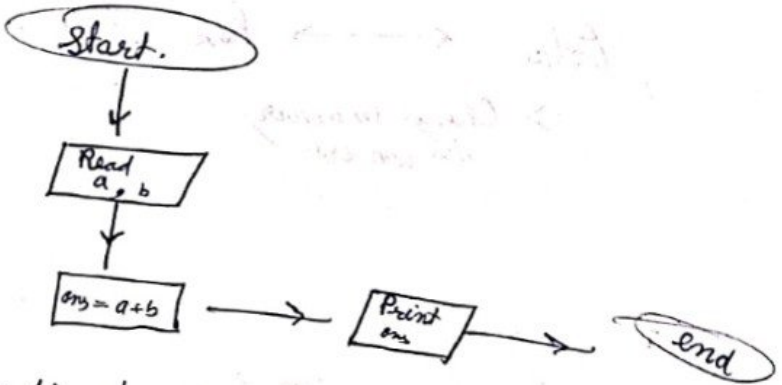
③ Process (Calculation & other)

④ Decision

⑤ Arrow (Flow)



→ Sum of 2 no



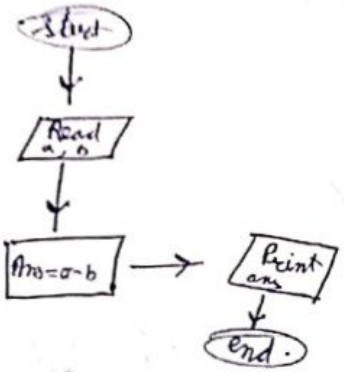
Pseudocode → basic instruction of english about code.

① Read a, b

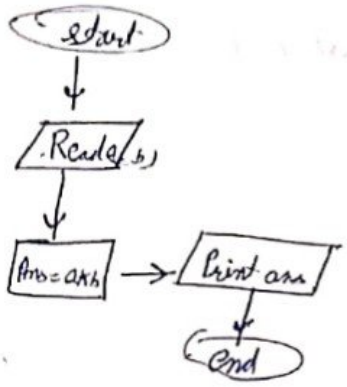
② ans = a+b

③ Print ans.

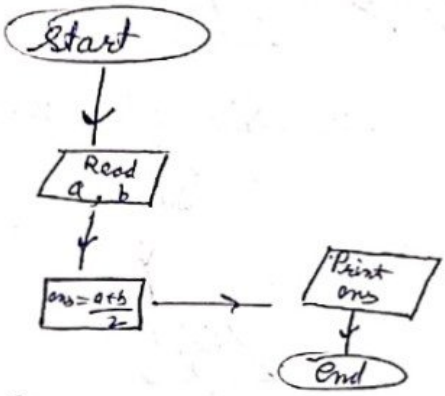
② Sub 2 no. →



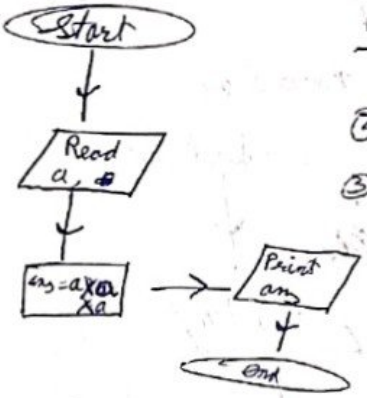
③ Product 2 no.



④ Average of 2 No.

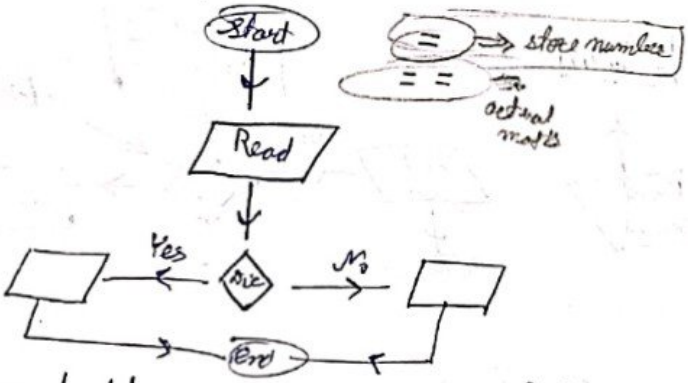


⑤ Cube of a number.

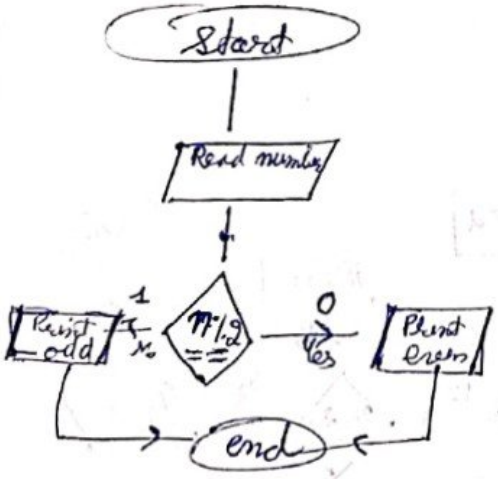


Pseudo code →
① Read n
② ans = n x n x n
③ Print ans

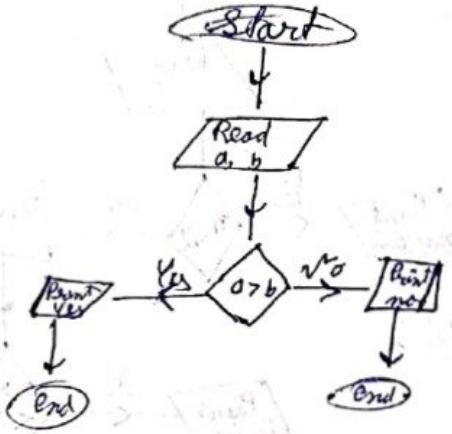
→ ~~Design~~ Decision making : ◇



⑥ Even / odd



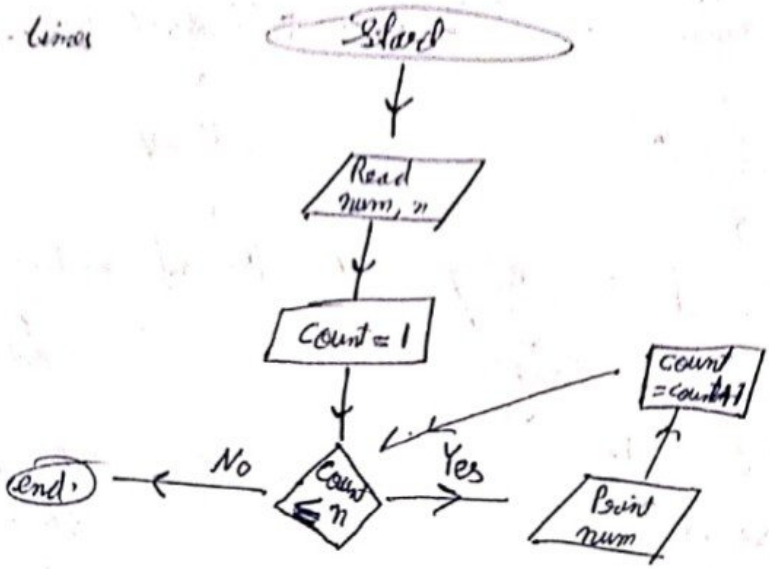
② Check a > b.



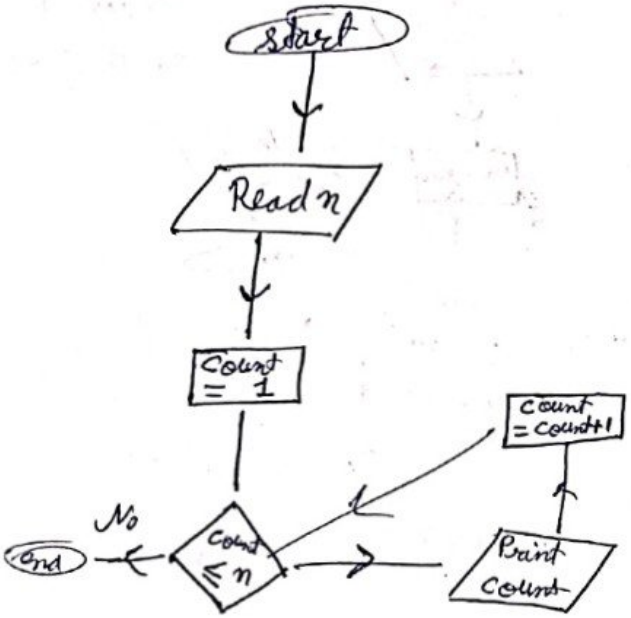
③ Check which is greater among 2 no.

⑧ Loop :-

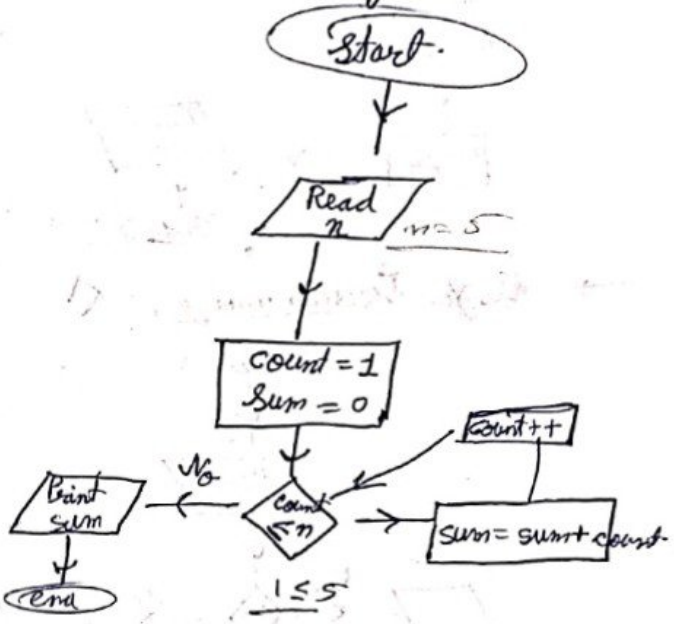
. num, Print n times



① Print n - natural no.

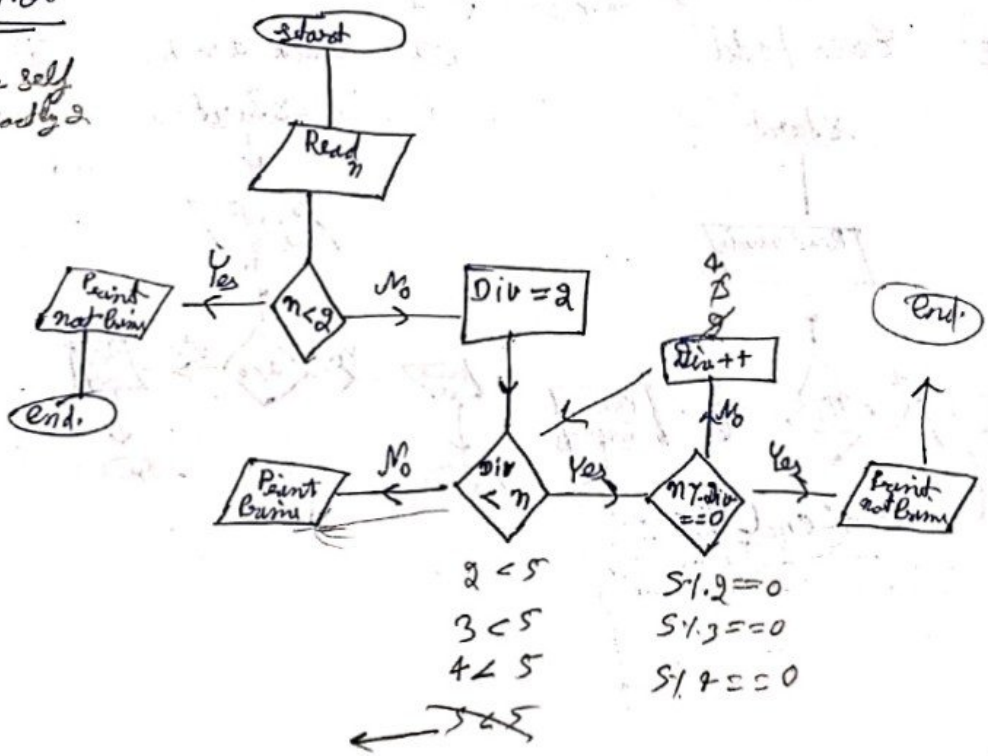


② Sum of n natural



③ Prime or Not

Prime => 1 or self
=> exactly 2



C++ - Introduction

Flowchart → [C++] → compiler → [Exe]

Transistor: → 0 off / 1 on ⇒ store 1 bit at a time

bit = 0 / 1.
8 bit = 1 byte.
1024 byte = 1 KB.
1024 KB = 1 MB.
1024 MB = 1 GB.
1024 GB = 1 TB.

ASCII: American Standard Code for Information Interchange.

A = 65 — a = 97
B = 66 — b = 98

• C++

① Syntax :

• .cpp

① <iostream>

```
#include<iostream>
int main ()
{
  std::count <<"Hello CR";
  std::cin
  std::vector
};
```

②

```
#include <iostream>
Using namespace std;
int main ()
{
   count <<"Hello CR";
   cin
   vector
};
```

→

count << 2+3; → 5.

count << "2+3"; → 2+3.

IDE = Integrated Development Environment
↓
V.S. code.

→ Next line ⇒ count << "Hello CR" << endl; ⇒ \n in C

→ also could use \n ⇒ count << "Hello CR\n";

* Variables & Datatype :

① INT : 1, 2, - - -
② float : 1.2, 2.7, 7.3
③ Double : 1.293, 2.678
④ Char : a, b, c
⑤ String : How are you
⑥ Boolean : 0 or 1

① int Name = 10 ;
↓ data Type
↓ Variable
assignment Operator

10
Name → 4 Bytes

4 Byte = 32 bit

Name
1 0 1 0 - - - 32 bit

10 = 1010 ⇒ 0 0 0 0 0 0 .. 1 0 1 0 ⇒ 32 bit

② Char ch = 'a' / 'b' / '0' / '1' / '2' ... ;

Char → data.

ch → Variable
{ Alphabet, (1–9), (_) }
→ (Not start with Number)

'a' → ascii = 97 → 1 Byte. → 8 bit
ch

Char ch = ab → only store single character

0 1 1 0 0 0 0 1 ⇒ 97
ch

③ float : 1.2, 2.6 ....

float f = 1.28 ; → 4 bytes.
data var.

1.28 = ----------
f

④ double d = 4.63326278
→ 8 bytes (64 bit)

→ int a = 29876348--58 ⇒ 40 bit number.
↳ but int store 32 bit (4 bytes).
→ Use long int a =..... ⇒ store 64 bit (8 bytes).

⑤ ~~Bol~~ Boolean : b = 0/1 ⇒ 1 byte.
data var

bool b = 0; (b = 0, b = 1, b = true, b = false)

0 → 1 byte (8 bit)
b

0 0 0 0 0 0 0 0 = 0

bool b = 0 ; / bool b = false

cout << b ; → 0

* Negative No

```
int a = -5;
```

as int = 4 byte (32 bit)
↳ Total 2^{32}

→ -2 ⇒ 2 = 0 1 0

1 0 1 ⇒ 1's complement

+1

1 1 0 → 2's complement ⟶ represent -2 in binary.

Let 3 bit

— — — ⇒ $2^3 = 8$

0	0	0	→ 0
0	0	1	→ 1
0	1	0	→ 2
0	1	1	→ 3
1	0	0	→ -4
1	0	1	→ -3
1	1	0	→ -2
1	1	1	→ -1

⇒ — — —

(-ve) ↙ ↘ (+ve)

2^2 space. ($-1 \to -2^2$)

2^2 ($0 \to 2^2-1$)

⇒ unsigned int — —

↳ Store only +ve numbers

32 bit

-ve: 2^{32} $(-1, -2, \ldots, -2^{31})$

+ve: 2^{32} $(0, 1, 2 \ldots, 2^{31}-1)$

→ Size of :-

```
int a = 123;
int size = sizeof(a);
cout << "Size of a is : " << size << endl;
```

↓

4

→ Type casting

① `int a = 'a';`
`cout << a << endl`

↓

97

② `char a = 98;`
`cout << a << endl;`

↓

b

→ operator:

+ - * / %

→ Relational oprtr

> < == != >= <=

= ↳ assignment operator

&& → and

|| → or

! → not

If Else Conditional Statement

→ input : cin

```
#include <iostream>
using namespace std;
int main () {
    int a, b;
    cin >> a;
    cin >> b;
    cout << a+b;
}
```

<< ⇒ Insertion operator.

>> ⇒ Extraction operator.

= ⇒ assignment operator

== ⇒ equal (comparision operator)

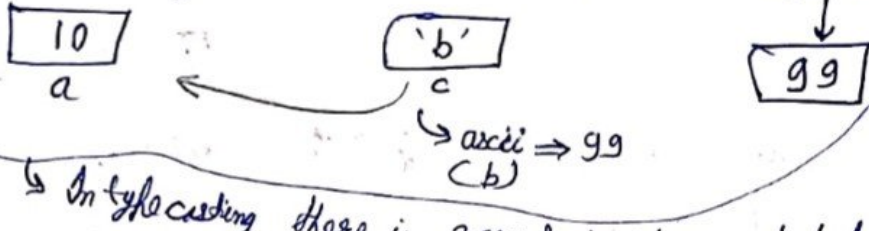
→ Typecasting

ascii ⇒ 0 - 255

int a = 10;

char c = 'b';

a = c



→ In typecasting there is very high chance of data loss if first datatype is bigger then assigned datatype then remain data will lost.

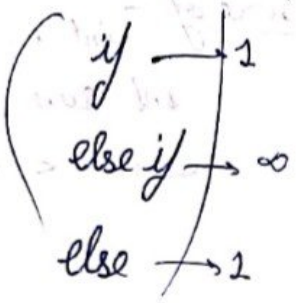
If - else.

◇ → (Division making)

Syntax

```
int Package = 15
if (Package > 10)
{
    cout << "accepted";
}
else
{
    cout << "rejected";
}
```

True then Run



① Comparison 2 number.

② Check Even or odd.

③ Vowel & Consonant. (if - elseif - else).

④ Number (1-7) print week (Mon - Sun).

loops

→ Count = 1
Count ≤ 5
Count "C R"
Count = Count + 1
variable ↓ assignment opr.

Syntax:

```
for (initilize ; loop break ; increment / Decrement)
{
    // code.
}
```

```
for(int i=1 ; i ≤ 10 ; i = i+1)
{
    cout << "Hello ";
}
```

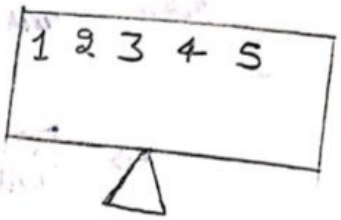
① ② ③ ④

i = 1
i ≤ 10
Print Hello
i = i + 1.

→ Print numbers (1-5)

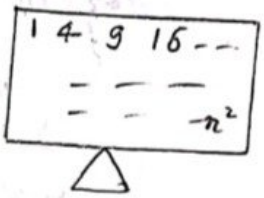
```
for (count=1 ; count≤5 ; count=count+1)
{
    cout << count;
}
```

→



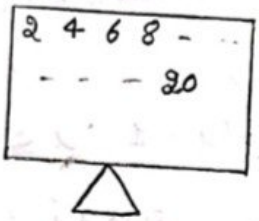
→ Print Square (1 - n)

```
for (int i=1; i ≤ n ; i++)
{
    cout << i*i;
}
```



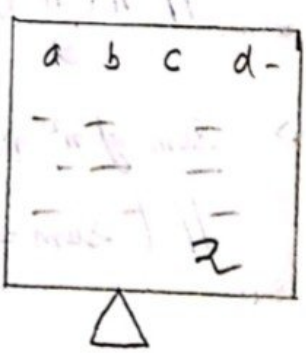
→ Print all even no (1-20)

```
for (int i=1; i ≤ 10; i++)
{
    cout << 2*i;
}
```



→ Print alphabate {a - z}

```
char name = 'a';   (Typecasting)
for (name = 'a'; name ≤ 'z'; name++)
{
    cout << name;
}
```



→ Table

```
int n;
for(int i=1; i<=10; i++)
{
cout<<n<<"X"<<i<<"="<<n*i<<endl;
}
```

⇒

```
7X1= 7
7X2 = 14
 .
 .
 .
7X10=70
```

→ Power.

n = 5 Pow = 4

5^4 → n*n*n*n

```
num = 5;
for (i=1; i<Pow; i++)
{
    num = num * n.
}
```

⇒ Debugging num=5; 4

i=1 ; i < Pow ; i++

num = 5 X 5 ①

25 × 5 - ②

125 × 5 ③

625 ⇒ Print

→

```
int num, Pow, n;
Cin >> num >> Pow;
  n = num
for(int i=1; i<Pow; i++)
  {
     num = num * n;
  }
  cout << num;
```

→ Sum of n natural no

```
Sum = 0
for (int i=1; i<=n; i++)
{
  Sum = sum + i;
}
cout << sum;
```

// $\frac{n(n+1)}{2}$.

→ Sum of n^2 no.

// [Sum = sum + i * i]

→ Factorial :

```
fact = 1;
for(int i = 1; i <= n; i++)
{
    fact = fact * i;
}
```

→ Prime number :

```
if (num < 2)
{
    cout << "Not Prime";
    return 0;
}
else {
    for(int i = 2; i < num; i++)
    {
        if (num % i == 0)
        {
            cout << "Not Prime";
            return 0;
        }
    }
    cout << "Prime";
}
```

→ Fibonacci Series :

fibo : 0 1 1 2 3 5 8 13 21 34.

F0 F1 F2 F3

0 + 1 → 1

Pre Previous + Previous → current

Current = Prev + Pre Prev

Pre Previous = Previous

Prev = current.

```
int fib1, fib2, fibn, n;
    cin >> n;
if (n == 0) {
    cout << 0;
    return 0;
}
else if (n == 1) {
    cout << 1;
    return 0;
}
fib1 = 0;
fib2 = 1;
for
```

fibn = fib1 + fib2;
fib2 = fib1;
fib1 = fibn;

```
for(int i = 2; i <= n; i++)
{
    fibn = fib1 + fib2;
    fib1 = fib2;
    fib2 = fibn;
}
cout << fibn;
}
```

Pattern Printing

2	3	0 → 2^2 ⇒ 2^2
2	1	1 → 2^3 ⇒ 0
	0	1 → 2^4 = 0

4

⇒ ans = ans + rem × 2^i

```
While (n)
{
  rem = n % 2;
  rem = rem ^ 1;
  n = n / 2;
  ans = ans + rem * mul;
  mul = mul * 2
}
```

^ (exor)

0 ^ 1 → 1
1 ^ 1 → 0

↳ Convert 0 to 1 or 1 to 0

Function

→ Reusability
→ Readability

Syntax :-

```
return_type fx^n name (Parameter 1, Parameter 2 ....)
{
    // code
    return value;
}
```

return type
→ int,
char,
double,
void,

→ Prime no.

```
bool Prime(int n)
{
  if(n < 2)
    return 0;
  for(i=2; i<n; i++)
  {
    if(n % i == 0)
  }     return 0;
  return 1; → bool se 1 if true.
}
```

→ Factorial

```
int fact (int n)          ---- fx^n declare.
{
    int ans = 1;
    for(i=1; i<=n; i++)
    {
      ans = ans * i;      ( fx^n define
    }
    return ans;
}
```

→ Main fx^n

```
int main()
{
   int a, b;
cout << Prime(a);   → argument.
<< fact(b);          fx^n call
<< Prime(a-b);
```

→ if :-

```
int Fact(int n=3)
// Default Parameter
```

↳ it pass 3 in fact if we don't pass any argument in main function.

→ Pass by value :-

```
void Incr(int n)
{
  n++;
}
int main()
{ int a=10;
  Incr(a);
  cout << a;
}
```

a → 4
n → 4 5 (n++)

→ does not increase value of 'a' it increase value of 'n'.
→ n में a की copy जाती है

→ Pass by Refrence :-

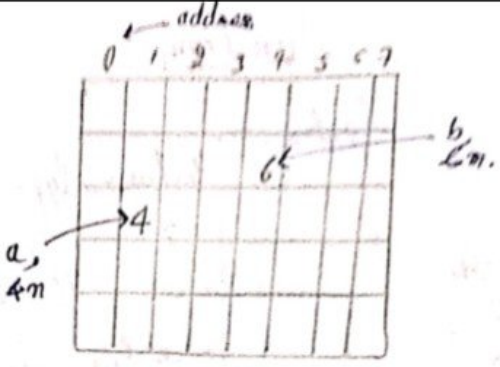
```
Void Incr(int &n)
{
    n++;
}
int main()
{
  int a = 10;
  Incr(a);
  cout << a;
}
```

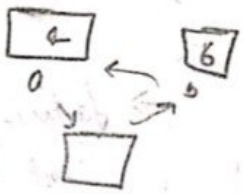
a 4 ← n

→ 'n' one 'a' जैसा होता है no कि 'a' की copy.
→ n store in form of address of 'a'.

→ Swapping two numbers:

```
void Swap(int &n, int &m)
{
    int c;
    c = a;
    a = b;
} b = c;
int main()
{
    int a, b;
    cin >> a >> b;
    Swap(a, b);
cout << a << b;
}
```





→ Swap fn is also a inbuild fn in C++:

swap ⟵ ~~Swap~~

→ Convert 'a' to 'A'. {a, b, c ---- z} → {A, B, C ---- Z}.

```
char convert(char name)
{
  char ans = name - 'a' + 'A';
  return ans;
}

cout << convert(name);
```

Debugging:

name - 'a' + 'A'

↓ 97 ↓ 65

'h' - 'a' + 'A'

↓ 107 - 97 + 'A' →

7 + 'A' ⇒ 'H'

→ Armstrong No.:

2 3 ⇒ 2 digit

→ $2^2 + 3^2 \Rightarrow 13$ ✗

1 5 3 (3 digit) / $1^3 + 5^3 + 3^3 \Rightarrow 153$ ⟵ → Armstrong no.

```
int CountDigit(int n)
{
  int count = 0;
  while(n)
  {
    count++;
    n /= 10;
  }
  return count;
}
```

↳ Count digit in the number

```
bool Armstrong(int num, int digit)
{
  int n = num, ans = 0, rem;
  while(n)
  {
    rem = n % 10;
    n /= 10;
    ans = ans + Pow(rem, digit);
  }
  if (ans == num)
    return 1;
  else
    return 0;
}
```

Pow(rem, digit) → Inbuild

(rem)^digit → 3^3

```
int main()
{
  int num;
  cin >> num;
  int digit = CountDigit(num);
cout << Armstrong(num,
                  digit);
}
```

→ Find Trailing zero in a factorial :-

6! → 1 × 2 × 3 × 4 × 5 × 6

1 2 3 2^2 5^1 2×3

⇒ $2^4 \times 3^2 \times 5$

→ $10 = 5 \times 2$ → how many "5 × 2" will help find the total 0's

∴ 6! ⇒ 720 → 1 zero.

8! ⇒ 40320 → 1 zero.

10! → 3628800 ⇒ 2 zero.

1 × 2 × 3 × 4 × 5 × 6 × 7 × 8

$2^4 \times 3^1 \times 5^1 \times 7$

⇒ $2^x 3^y 5^z$

always $x > z$ → To find z

1 × 2 × 3 × 4 × 5 × ... × 10 × ... × 15 × ... 20 ... 25 ... 30 ... 35 ... 50.

5¹ 5 × 2 5 × 3 × 2 5×2^2 5 × 5 (2 fives) 5 × 2 × 3 35 50 5 × 5 × 2

→ logic ⇒ !n ⇒ ans = n/5 for n < 5

if n > 5

!n ⇒

- ans = n/5 = 5
- ans = 5/5 = 1

ans = 5 + 1 = 6

eg: ⇒ 100!

⇒ 100/5 ⇒ 20;

20/5 = 4 ⇒ 20 + 4 ⇒ 24 zeros

eg ⇒ 148!

148/5 = 29

29/5 = 5

5/5 = 1

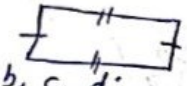
⇒ 29 + 5 + 1

⇒ 35 zeros

Code :-

```
int num = ;
int ans = 0;
while (num >= 5)
{
    ans = ans + num / 5;
    num /= 5;
}
cout << ans;
}
```

→ Rectangle



```
int a, b, c, d;
if ((a == b && c == d) || (a == c && b == d) || (a == d && b == c))
    return 1;
else
    return 0;
```

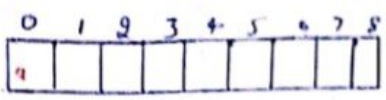
    no. 4 ka factor
    return 0; me haranga.
else
    return 1; me jeetunga
```

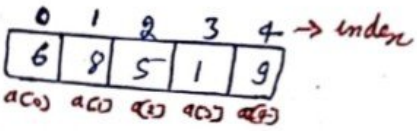
Arrays



→ Array store same type of data type at contigous location. (1000, 100)
address of arr[] — size of array

int a[1000];
data type. name — size of array

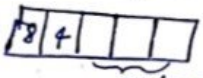
→ ① int a[5] = {6, 8, 5, 1, 9}



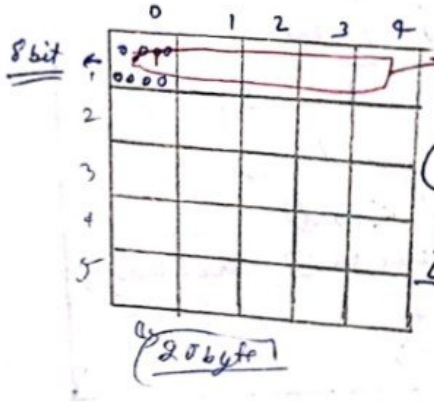
② int a[] = {6, 7, 9, 12};

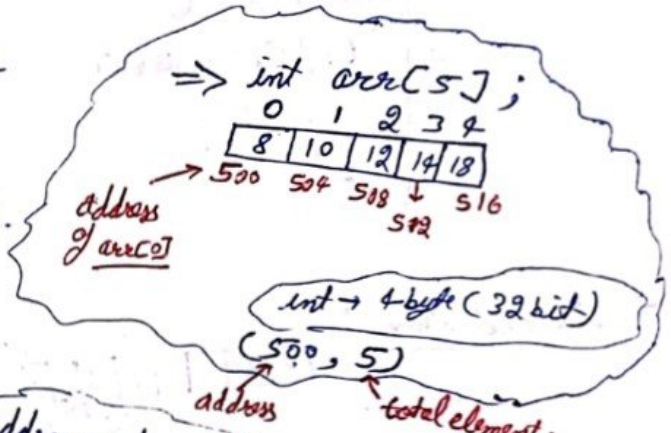
③ int arr[10]; => loop (cin >> arr[i]) // user input.

④ int arr[5] = {8, 4}

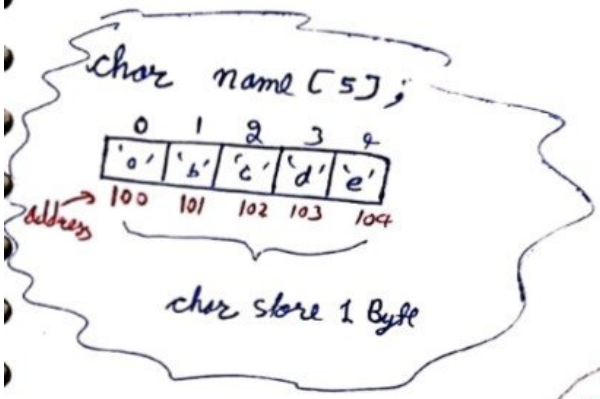


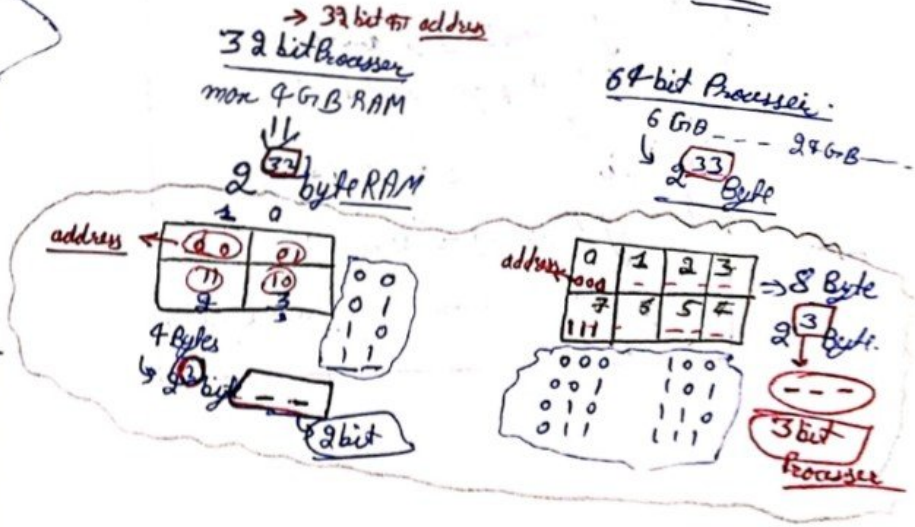
⑤ int arr[5] = {0}; // initialise Zero: {0 0 0 0 0} => only true for '0'.





→ address of index :=>
arr + index × size of data type.
for 2: index 500 + 2 × 4 => 508

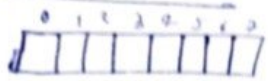




=> find min in arr:

```
int arr[5] = {...};
int ans = arr[0];
for (int i=0; i<5; i++)
{
    if(arr[i] < ans){
}       ans = arr[i];
cout << ans;
```

→ Search Element :

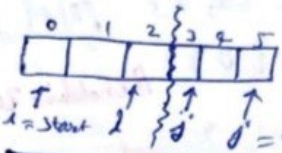


```
int arr[6] = { ... };
int x = ?;
int index = 0;
for (i = 0; i <= 5; i++)
{
    if (arr[i] == x)
    {
        index = i;
    } break;
    else {
        } return -1;
}
cout << index;
```

→ Reverse Array :

```
int arr[6], temp[6]
int i = 5, j = 0
while (i >= 0)
{
    temp[j] = arr[i];
    j++;
    } i--;
```

&



```
int arr[6] = {      };
int start = 0, end = 5;
while (start < end)
{
    swap (arr[start], arr[end]);
    start++;
} end--;
```

→ Second Max :

```
int arr[6] = {...};
int ans = 0 ~~arr[0]~~;
for (i=0; i <= 5; i++)
{
    if (arr[i] > ans ~~arr[0]~~)
    {
        ans = arr[i];
    }
}
for (i=0; i < ~~6~~ ; i++)
{
    if (ans != arr[i])
        ans = max (ans, arr[i]);
}
```

→ Missing No :-

as N = 6

then size of arr = N-1

$1 \le arr[i] \le N$ → | 1 | 2 | - | - | N |

  }
  arr[0] = temp;
  Print array
```

→ Array as function :-

Not a array ⇒ it is address

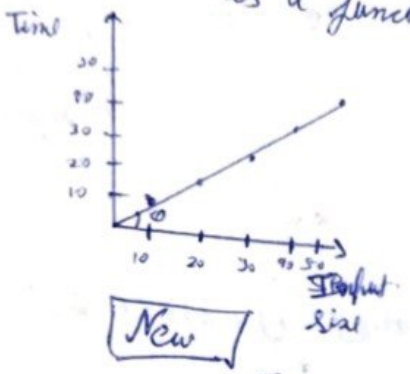
Pointer

```
void fun (int arr[], int n)
{ for (i=0; i<5; i++)
    cout << arr[i];
}
int main()
{ int arr[5] = {1, 2, 3, 5, 7}
    fun (arr, 5);
}
```

Time & Space Complexity

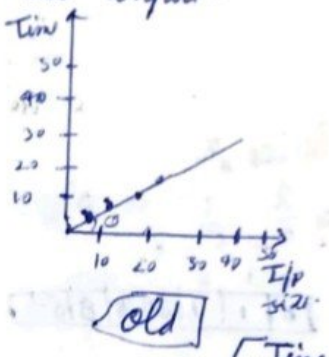
Time Complexity != Time taken

↳ It is the total time taken by an algorithm to run as a function of length of the input.



New

(Time = n)



Old

(Time = $\frac{n}{2}$) ≈ n

Big (O) {worst case}

$O(n)$

Ω {Best case}

$\Omega(n)$

Θ {Avg case}

→

```
for(i=1 ; i<=n ; i++)   // 1 → ①, i=1 → ②, i<=n → ③, i++ → ④
{
    cout << "chamka";
}
```

program 1st time ⇒ 4 steps.
2nd time ⇒ 3 steps

$\underset{1st}{4} + \underset{2nd}{3} + \underset{3rd}{3} + \dots + \underset{n^{th}}{3} \Rightarrow 3n+1$

→ Ignore constant ⇒ $n = O(n)$

→ If multiple dependency

$2N^3 + 3N^2 + N$ ⇒ take max ⇒ $N^3 = O(n)$

→

```
cin >> n
for(i=0 ; i<10 ; i++)
{
    cout << "chamka";
}
```

for n = 10 } output 10 times
for n = 100 } 10 times

doesn't depend on 'n'.

$O_{10} = O_{(1)} = \Omega_{(1)} = \Theta_{(1)}$

↓ constant.

order 1

→ [cout << n(n+1)/2;] ⇒ Order ⇒ $O(1)$

STL / Vector

Standard Template library

→ How to declare vector : vector <datatype> name;

→ How to insert value in vector : vector <int> V (size of vector, initialize)

- vector <int> V(4) ⇒ | | | | |
- vector <int> V(4, 2) ⇒ | 2 | 2 | 2 | 2 |

→ vector <int> a;

a.push_back (4); | 4 | a

a.push_back (8); | 4 | 8 |

a.push_back (5); | 4 | 8 | 5 | |

a.push_back (7); | 4 | 8 | 5 | 7 | | | |

a.push_back (17); | 4 | 8 | 5 | 7 | 17 | | |

→ vector <int> V = {2, 4, 6, 8, 10};

| 2 | 4 | 6 | 8 | 10 |

→ vector <int> V(5);
for (i=0; i<5; i++)
{
cin >> V[i];

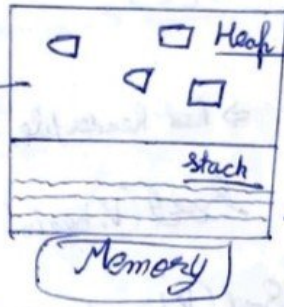
→ arr[n] ✗ (dynamic nA)

arr[1000] ✓

stack (Static memory allocation)

vector <int> V(n) → in heap

RAM



→ how to remove value from vector :

V | 2 | 4 | 6 | 8 | (0 1 2 3)

- V.pop_back(); → | 2 | 4 | 6 | | T.C. O(1)
- V.clear(); → | | | | |
- V.erase(V.begin()+2) → | 2 | 4 | 8 | | T.C. O(n)

(remove 2nd index value.)

→ Size & Capacity :

vector <int> V;

	size	capacity
V.push_back(1);	1	1
V.push_back(2);	2	2
V.push_back(10);	3	4
V.pop_back();	2	4

→ front, back, at, empty :

| 2 | 4 | 6 | 8 |

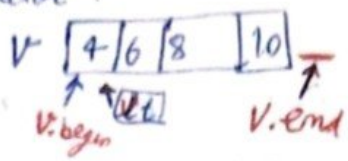
cout << V.front(); → 1

cout << V.back(); → 8

cout << V.empty(); → 0 (false)

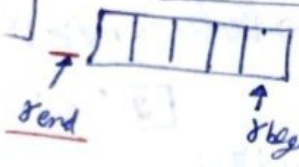
→ Iterator in a vector :

[V.begin()
V.end()]



```
for (auto it = V.begin(); it != V.end ; it++)
{
    cout << *it << " ";
}
```

[V.rbegin();
V.rend();]

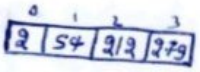


→
```
for (i = 0 ; i < V.size() ; i++)
    cout << V[i];
```

```
for (auto i : V)
cout << i ;
```

→ Sorting ⇒ Must header file : (#include <algorithm>).

Sort(V.begin(), V.end()); → Inc → 
Sort(V.begin(), V.end, greater<int>()); → Dec → 
→ Search • Sort vector before binary search.



cout << binary_search(ans.begin(), ans.end(), 54); → 0/1 true false.

- find :- cout << find(ans.begin(), ans.end(), 212) - ans.begin(); → 2

(212 ke jo iterator point kr rha hai) - (begin() wala iterator)

→ Insert :- V.insert(V.begin() + 1, 50);

↳ insert 50 at 2 V[1]

→ Count :-

int ct = count(V.begin(), V.end(), 5); ⇒ count how many times specific value occurs.

→ Max & Min :-

int maximum = max_element(V.begin(), V.end()).
min

↳ find max/min element

↳ find iterator pointing to the largest / smallest element in given range

Two Pointer

→ Segregate 0 and 1 :

0	1	2	3	4	5
1	0	1	0	1	0

⟶

0	0	0	1	1	1

① Sorting → $O(N^2)$

② Sort(arr.begin(), arr.end) → $O(N \cdot \log N)$.

③ count 0 = 0 + 0 + 3 → 3 0's

count 1 = 0 + 0 + 3 → 3 1's → $O(n)$

```
int count0 = 0
int count1 = 0
for (i=0; i<n; i++)
{
    if (arr[i] == 0)
        count0++;
    else

{
    cout << * Ptr;
    Ptr++;
}
```

Ptr = Ptr+1
Ptr = 500 + 1 x 4
Ptr = 504 $\rightarrow$ Now Ptr changes

(increment / decrement ++ --)

$\rightarrow$ ~~arr++~~ ~~arr--~~ $\Rightarrow$ arr store address of 0th index
a++ change the address which cause data loss.

→ Pointers with char array :-

```
char arr[5] = "1234"
char * ptr = arr (address)
cout << arr;   → 1 2 3 4
cout << ptr;   → 1 2 3 4
```
(This print values till '\0')

output:

exploded
500 ✗
500 ✗

arr → 500

0	1	2	3	4
1	2	3	4	\0
500	501	502	503	504

To print address:
cout << (void*) arr;
cout << (void*) ptr;
<typecasting>

500
500

cout << static_cast<void*>(arr) << endl;

* Pass by value

```
void incr(int n)
{
  n++;
}
int main()
{
  int num = 10;
  incr(num);
  cout << num;
}
```

n (500): 10 → 11

num (800): 10

output: 10

* Pass by ~~reference~~ Pointer

```
void incr(int * ptr)
{
  *ptr++;
}
int main()
{
  int num = 10;
  incr(&num);
  cout << num;
}
```

ptr (500): 200

* ptr = value at address of ptr

num (940): 10 → 11

output: 11

→ In array.

```
void dob(int * ptr) // (int p[])
{
  for(i=0; i<5; i++)
    p[i] = 2 * p[i];
}
int main()
{
  int arr[5] = {1,2,3,4,5};
  dob(arr);
  for(i=0; i<5; i++)
    cout << arr[i]
}
```

This store address of 0th index

arr →

0	1	2	3	4
2	4	6	8	10
200	204	208	212	216

p[0] = 2 * 2 = 4

*(p+0) = 2 * [*(p+0)]
2 * 2 = 4.

p[1] = 2 * p[1]
*(p+1) = 2 * *(p+1);
2 * 4 ⇒ 8.

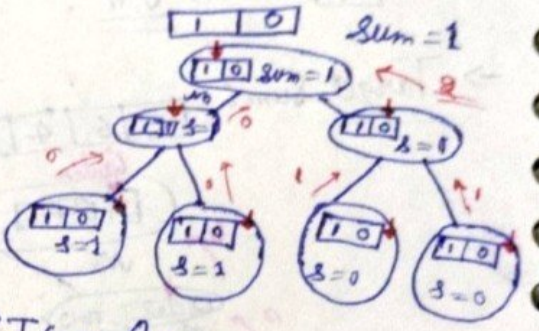
int subset (int arr[], int index, int n, int sum)
{
    if (sum == 0)
        return 1;
    if (sum < 0 || index == n)
        return 0;

    return subset (arr, index+1, n, sum) +
           subset (arr, index+1, n, sum - arr[index]);
}
```

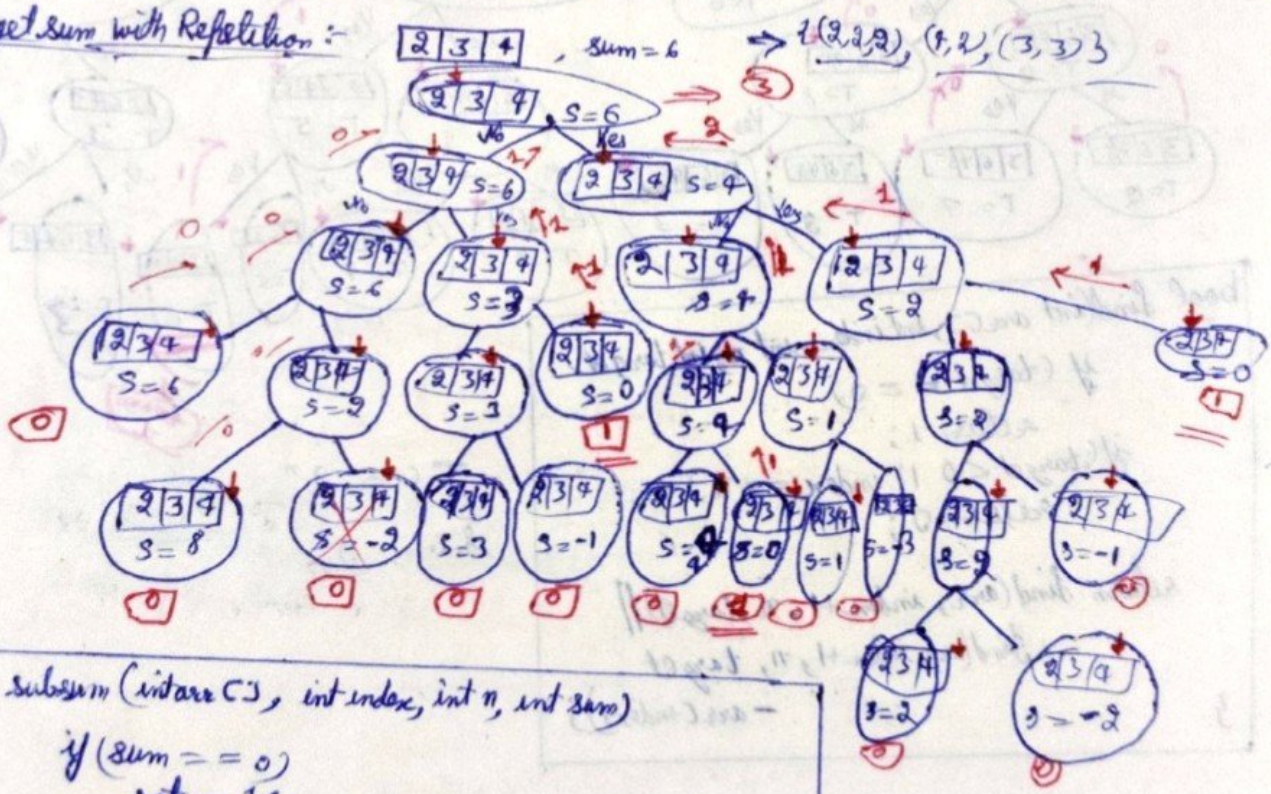
```
if (index == n)
{
    if (sum == 0)
        return 1;
    else
        return 0;
}
```

// if only arr[index] = 0



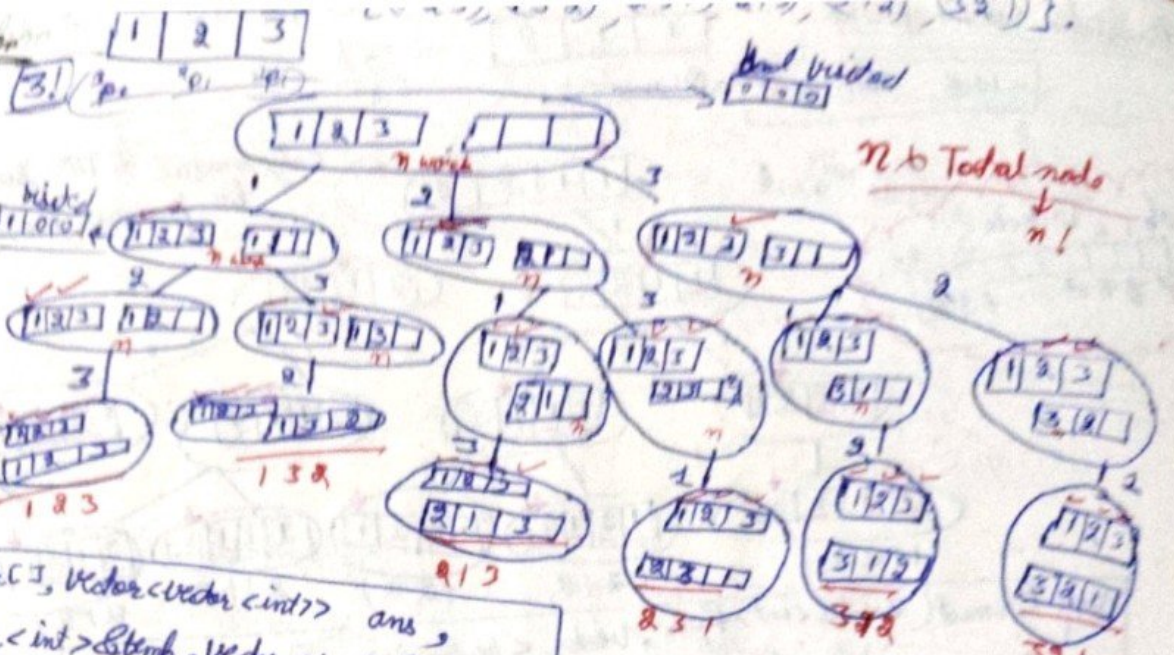
→ T.C. → $O(2^n)$

→ Target sum with Repetition :- [2 | 3 | 4] , sum = 6 → {(2,2,2), (4,2), (3,3)}



```
int subsum (int arr[], int index, int n, int sum)
{
    if (sum == 0)
        return 1;
    if (index == N || sum < 0)
        return 0;
    return subsum (arr, index+1, n, sum) +
           subsum (arr, index, n, sum - arr[index]);
}
```

→ Permutation



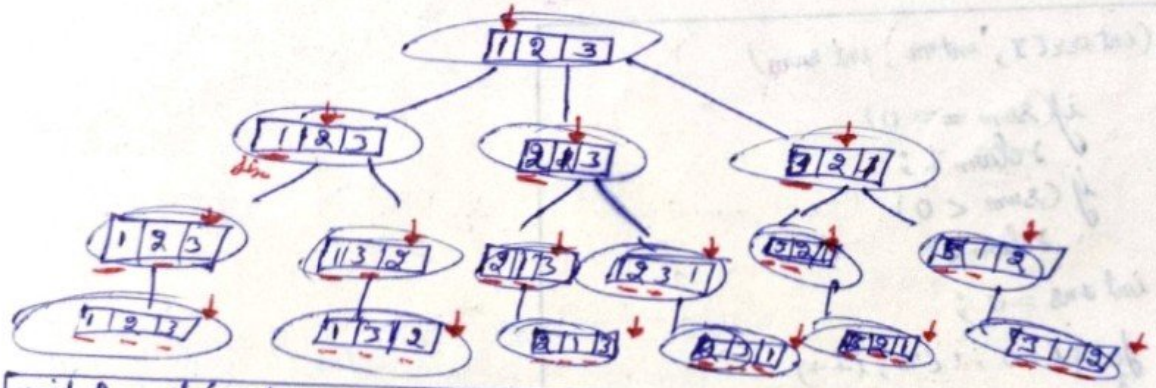
```
Permut(int arr[], vector<vector<int>> ans,
       vector<int> &temp, vector<bool> &visited)
{
    if (visited.size() == temp.size())
    {
        ans.push_back(temp);
        return;
    }
    for(int i=0; i<visited.size(); i++)
    {
        if (visited[i] == 0)
        {
            visited[i] = 1;
            temp.pushback(arr[i]);
            Permut(arr, ans, temp, visited);
            visited[i] = 0;
            temp.pop_back();
        }
    }
}
```

n work

$= n! \Rightarrow n!$ = total nodes.

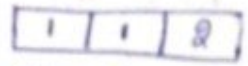
T.C. $\Rightarrow O(n \times n!)$

S.C. $\Rightarrow O(n)$ → ans (vector) / n + n + n / stack



```
void Permut (vector<int> &arr, vector<vector<int>> &ans, int index)
{
    if (index == arr.size())
    {
        ans.push_back(arr);
        return;
    }
    for(int i = index; i < arr.size(); i++)
    {
        swap(arr[i], arr[index]);
        Permut(arr, ans, index+1);
        swap(arr[i], arr[index]); // return to back position
    }
}
```

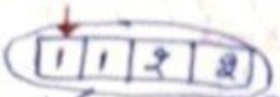
Permutation with repetition



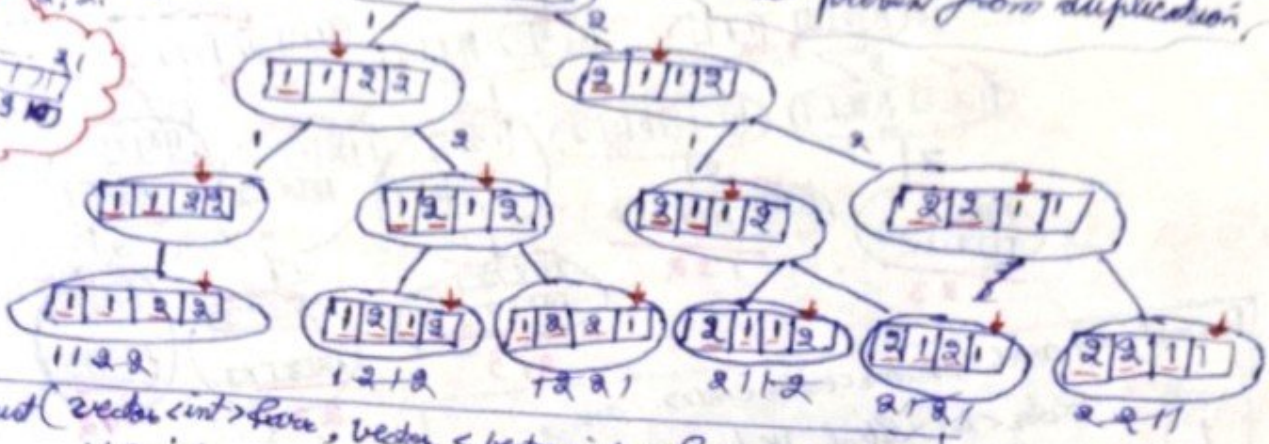
$\frac{3!}{2!} = 3$

$-10 \le num \le 10$ → 21 numbers

$\frac{4!}{2!2!} = \frac{24}{4} = 6$



⇒ Only unique 6 will swap because back to prevent from duplication.



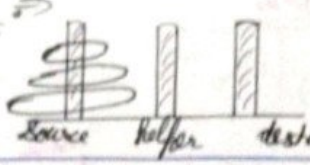
```
void Permut(vector<int>&arr, vector<vector<int>>&ans, int index)
{
    if(index == arr.size()-1)
    {
        ans.push_back(arr);
        return;
    }
    vector<bool> Track(21,0);
    for(i=index; i<arr.size(); i++)
    {
        if(Track[arr[i]+10] == 0)
        {
            swap(arr[index], arr[i]);
            Permut(arr, ans, index+1);
            swap(arr[index], arr[i]);
            Track[arr[i]+10] = 1;
        }
    }
}
```

→ Way to Sum N:

{ 1+1+1+1+1+1 , 1+1+5, 1+6, 1+5+1, 5+1+1, 6+1 }

```
int way(int arr[], int m, int sum)
{
    if(sum == 0)
        return 1;
    if(sum < 0)
        return 0;
    int ans = 0;
    for(i=0; i<m; i++)
    {
        ans += way(arr, m, sum - arr[i]);
    }
    return ans;
}
```

→ Tower of Hanoi :-



① 1 baar me 1 hi disk move kar sakte ho, only top wali.
② Choti disk ke upar badi disk nahi rakh sakte.

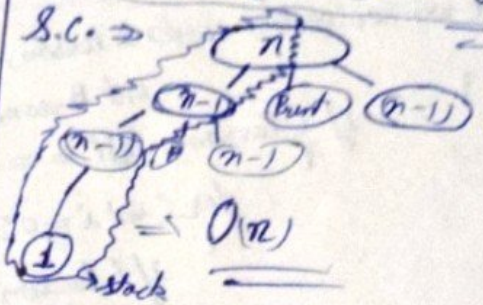
```
void Toh(int n, int sour, int help, int dest)
{
  ① if(n==1)
    {
      cout << "Move disk" << n <<
              "from" << sour << "to" << dest;
      return;
    }
  ② Toh(n-1, sour, dest, help);
  ③ cout << "Move disk" << N << "from" << sour
          << "to" << "dest";
  ④ Toh(n-1, help, sour, dest);
}
```

n = 3 ⇒ 7 steps

n = 4 ⇒ 15 steps

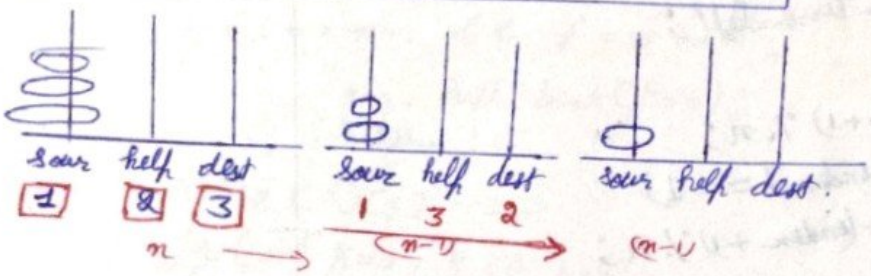
T.C. ⇒ $(2^n - 1) = O(2^n)$

S.C. ⇒

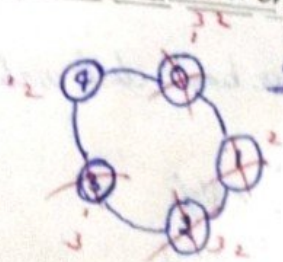


$= O(n)$

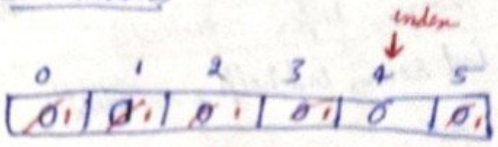
① → last one.
② → first execute till n = = 1)
③
④ → after ② till n = = 1).



→ Predict the winner :- Josephus Problem



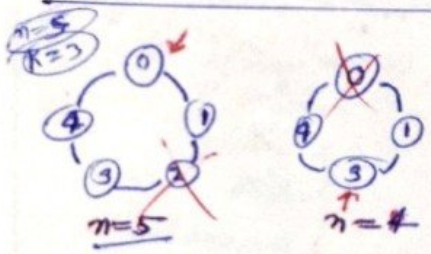
n = 5 , K = 3 (eleminate)

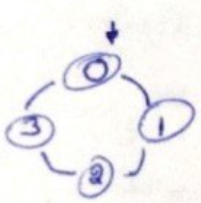


index = (index + 1) % n.

```
int winner (vector <bool> &Person, int n, int index,
            int Person_left, int K).
{
    if (Person_left == 1)
    {
        for (int i=0; i<n; i++)
        {
            if (Person[i] == 0)
                return i;
        }
    int kill = (K-1) % Person_left;
    while (kill --)
    {
        index = (index+1) % n;
        while (Person[index] == 1)
            index = (index+1) % n;
    }
    Person[index] = 1;
    while (Person[index] == 1)
    {
        index = (index+1) % n;
    }
    return Winner (Person, n, index, Person_left-1, K);
}
```

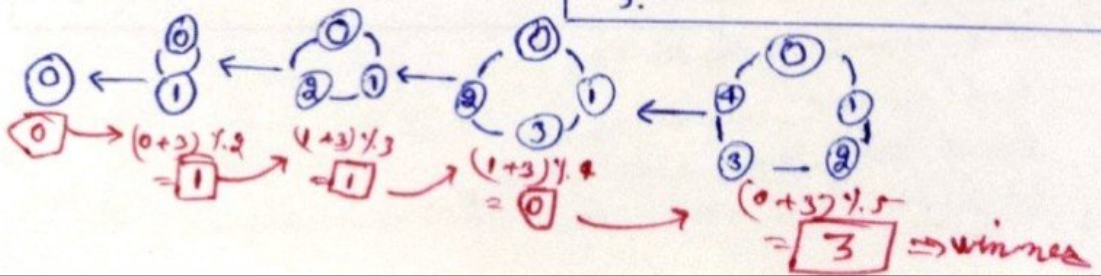
→ T.C. = O(n²).
S.C. = O(n).



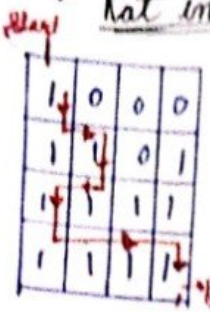


```
int winner (int n, int k)
{
    if (n == 1)
        return 0;
    return (Winner(n-1, k)+K) % n;
}
```

→ T.C. = O(n).
S.C. = O(n).



→ Rat in a Maze :



n (row, column)

up : U
Down : D
Left : L
Right : R

① Don't go outside matrix.
② Only go with 1 and with 0.
③ Never visit back to visited box again.

Path : DRDLDRRR
DRDDRDR } 2 Paths

(i, j)

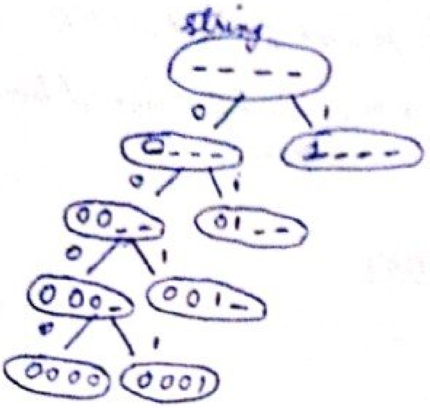
	row, col
up : i-1, j.	(-1, 0)
Down : i+1, j.	(1, 0).
left : i, j-1.	(0, -1).
Right : i, j+1.	(0, 1).

```
void Total(vector<vector<int>>& matrix, int i, int j,
           int n, string Path, vector<string>& ans, vector<vector<bool>>& visited)
{
    if (i == n-1 && j == n-1)
    {
        ans.push_back(Path);
        return;
    }
    visited[i][j] = 1;
    for (int K=0; K<4; K++)
    {
        if (valid(i+row[K], j+col[K], n) && matrix[i+row[K]][j+col[K]]
            && !visited[i+row[K]][j+col[K]])
        {
            ~~if(valid(i+row[K], j+col[K], n) && matrix[i+row[K]][j+col[K]] && visited[i~~
            Path.push_back(dir[K]);
            Total(matrix, i+row[K], j+col[K], n, Path, ans, visited);
            Path.pop_back();
        }
    }
    visited[i][j] = 0;
}
```

```
bool valid(int i, int j, int n)
{
    return i>=0 && j>=0 && i<n && j<n;
}
```

T.C. = 3^{N^2}

⇒ N - Bit binary Number : find all N bit binary numbers having ... equal to 1 than 0 for any prefix.



1 1 0 1

one ≥ zero

zero 0 1

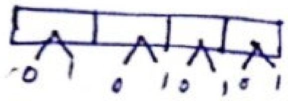
one ~~0 1 2~~ 3

1 0 0 0

zero 0 1 2

one 0 1

zero > one

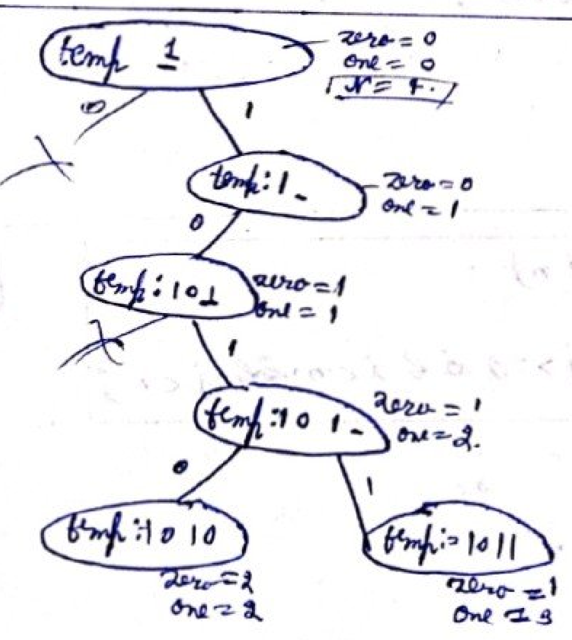


zero : 0
one : 0

if (zero <= one)

```
void find(int N, vector <string> &ans, string& temp,
          int zero, int one)
{
    if(temp.size() == N)
    {
        ans.push_back(temp);
        return;
    }

    if(zero < one)
    {
        temp.push_back('0');
        find(N, ans, temp, zero+1, one);
        temp.pop_back();
    }
    temp.push_back('1');
    find(N, ans, temp, zero, one+1);
    temp.pop_back();
}
```



Object Oriented Programming

It is an approach or Programing pattern where the programs are structured around objects rather than function and logic.

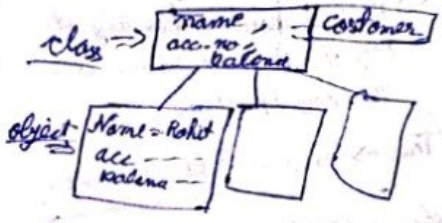
```
class student → Data Type (user define)
{
  public:
    string name;
    int age, roll_no;
    string grade;
};
int main
{
    student S1; → object
    S1.name = "Harsh";
    S1.age = 10;
    S1.roll_no = 2139;
    S1.grade = "A+";
}
```

→ Private : (Default)
Public :
Protected :

```
class student
{
  Private:
  string name;
  int age, rollno;
  // function → setter or getter.
  Public:
  void setname(string n)   ← function
  {
    name = n;
  }
  void getname()
  {
    cout << name << " ";
  }
int main()
{
  student S1;
  S1.setname("Harsh");
  S1.getname();
```

→ Class : • It is user defined data type.
• Blue print for created object.

→ Object : • It is an entity that has a state and Behaviour.
• Anything that exist in Physical World.

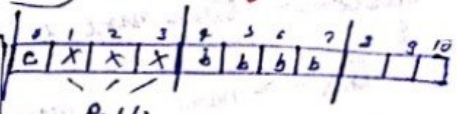


Empty class size = 1

* Padding

```
class a
{
  char c;
  int b;
};
int main()
{
  a obj
  cout << sizeof(obj);
}
```

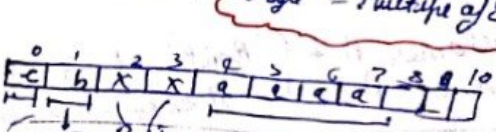
8



32 bit OS
64 bit OS
→ 4 byte

1 byte = Multiple of 1.
2 byte = Multiple of 2.
4 byte = Multiple of 4
8 byte = Multiple of 8.

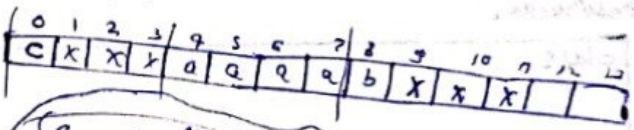
```
char c; → 1
char b; → 1
int a;  → 4
```



⇒ 8 byte.

```
char c; → 1
int a;  → 4
char b; → 1
```

→ 4 byte



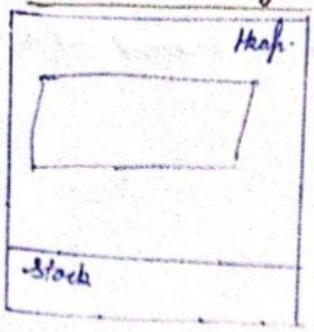
Greedy allignment → Sabse bada Sabse upper

⇒ 12 byte.

but 9 does not divide 4 completly so data divisible of 4 nearest by increasing 9× → 12 ✓

Correcty allignment : Biggest byte data type upper

→ Static vs Dynamic Memory Allocation:



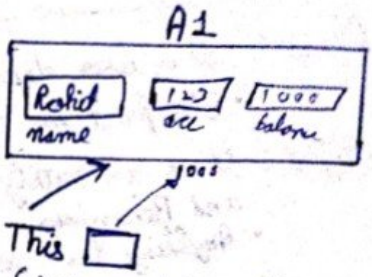
```
Student *s = new Student;
(*s).name = "Harsh";
s -> name = "Harsh";
```

* **Constructor**: It is a special fx^n that is invoked automatically at the time of object creation.
  - Name of the construction should be same as class name.
  - It doesn't have any return type.
  - It is used to initilize the value.

```
Class customer
{
    string name;
    int account_number;
    int balance;
    customer ()    // Default construction.
    {
      cout << "Construction is called";
    }

    // Parameterized construction.
    customer (string name, int account_number, int balance)
    {
      this -> name = name;
      this -> account_number = account_number;
      this -> balance = balance;
    }
};

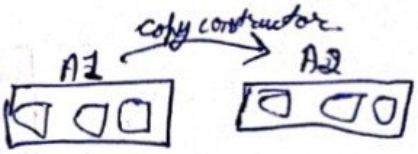
int main()
{
      customer A1 ("Rohit", 123, 1000);
      customer A2(A1) // copy constructor
}
```



() this is a pointer pointing a object A1 & store it's memory location("1001")

This -> name ≡ (*this). name.

```
customer (string a, int b, int c)
{
    name = a
    account_number = b
    balance = c
}
```



display the objects

```
Void display()
{
    cout << name << acc_no << balance;
}
int main()
{
    customer A1();
    A1.display();
}
```

A1 → A2

Copy Constructor

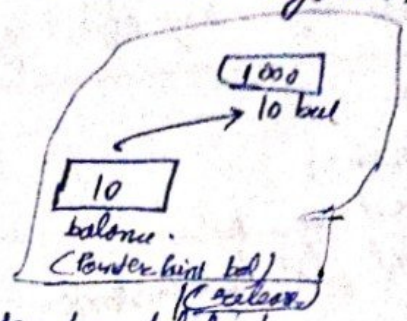
```
class - -
{

    // copy constructor.
    customer (customer &B)
    {
      name = B.name;
      account_number = B.account_number;
      balance = B.balance;
    }
};
int main()
{
      customer A2 (A1)
}
```

Copy Constructor :-

* Destructor :- It is an instant member fx" that is invoked automatically whenever an object is going to be destroyed.
  - it is a last fx" that is going to be called before an object is destroyed.

```
class customer
{
    string name;
    int * balance;
  public:
  customer (string name, int bal)
  {
    this -> name = name;
     balance = new int;
    * balance = bal;
  }
~ customer ()                    // destructor
    {
        delete balance;
    }
};
int main ()
{
  customer A1("Rohit", 1000);
}
```



destructor delete dynamic memory "balance".
(memory used in heap) → release heap memory.

→ compiler automatic made destructor if user can't.
→ destructor created only once.

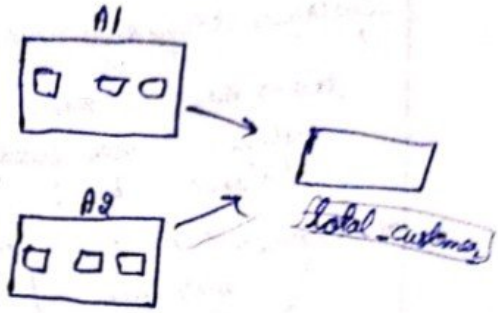
constructor call order wise objects.
but destructor call reverse order objects.

* Static data member

- They are attribute of class or class member.
- it is declared using static keyword.
- only copy (one) of that member is created for the entire class & is shared by all the class
- It is initialized before any object of this class is created.

```
class customer
{
    string name;
    int account_no, balance;
    static int total_customer;
    public:
        customer (string a, int b, int c)
        {
            name = a;
            acc_no = b;
            balance = c;
            total_customer ++;
        }
};

int customer :: total_customer = 0;
int main()
{
    customer A1("Rohit", 1, 1000);
    customer A2("Mohit", 2, 200);
}
```



// const -

* Encapsulation : Wrapping up of data & information in a single unit, while controlling access to them.

- data hiding

```
class customer
{
    string name;
    int balance, age;
    public:
    customer(string a, int b, int c)
    {
        name = a;
        balance = b;
        age = c;
    }
    void deposit(int amount)
    {
        if (amount > 0)
            balance += amount;
        else
            cout << "Invalid amount";
    }

int main() {
    customer A1("Hasan", 5000, 19);
    deposit(10000);
}
```

→ to secure data, data should be valid given by the user.

Abstraction :- Display only essential information & hiding the details.

* Inheritance :- The capability of a class to derive property & characteristic from another class.

	external class	within class	derived class
Public :	✓	✓	✓
Protected :	X	✓	✓
Private :	X	✓	X

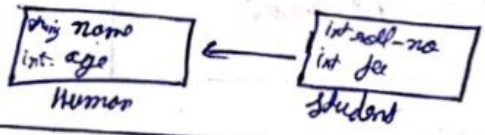
```
class
Private :
    int a ;
Protected
    int b ;
Private :
    int c ;
```

→ (class student : access_modifier Human
{
};)
(Public / Private / Protected)

Base class	child class	
Public	Public	Public
Public	Protected	Protected
Public	Private	Private.
Protected	Public	Protected
Protected	Protected	Protected
Protected	Private	Private.

Type of Inheritance :

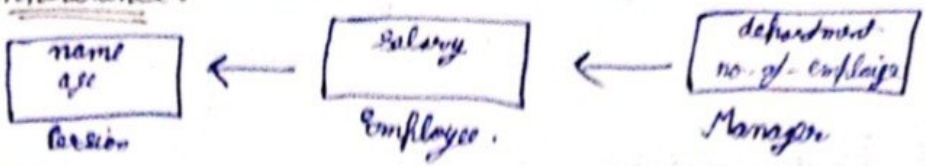
① Single Inheritance :



```
class Human
{   public :
    string name ;
    int age, weight ;
    // constructor
    Human ( )
    {
        cout << "Hello Human \n";
    }
};
class student : public Human
{
        int roll_no, fees ;
        public :
    student ( ) // constructor
    {
        cout << "Hello Student \n";
    }
};
int main ( )
{
        student A1 ;
}
```

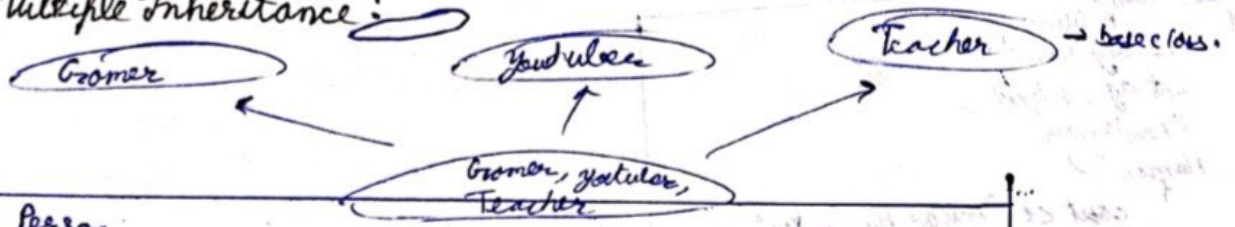
Output ⇒ (Hello Human
Hello Student)

* Multilevel Inheritance:



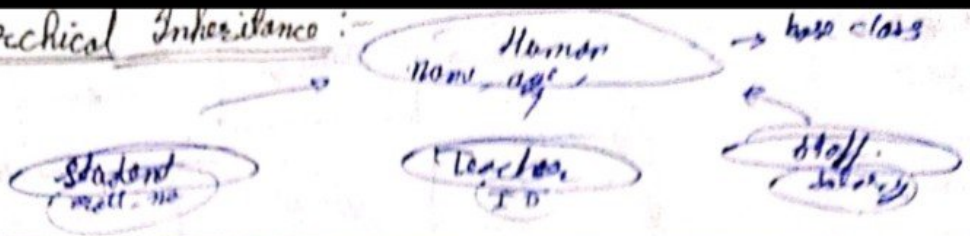
```
class Person
{
    Protected :
     string name;
    Public :
    void intro()
    {
      cout << "My name is " << name ;
    }
};
class Employee : Public Person
{
      Protected :
      int salary ;
      Public :
        void monthly_sal()
        {
          cout << "My monthly salary is " << salary ;
        }
   };
class Manager : Public Employee.
{
      Protected :
string ~~int salary~~ department;
      Public :
      manager (string name, int salary, string department)
      {
        this → name = name;
        this → salary = salary;
        this → department = department;
      }
};  display
```

③ Multiple Inheritance:



```
class Person
{  Public :
     string name;
};
class Teacher
{   Public :
     string specialization;
};
class youtuber
{   Public :
     int subscriber;
};
class code_teacher : Public Person, Public Teacher, Public youtuber.
{
     cout << name << specialization << subscriber.
}
```

Hierarchical Inheritance :

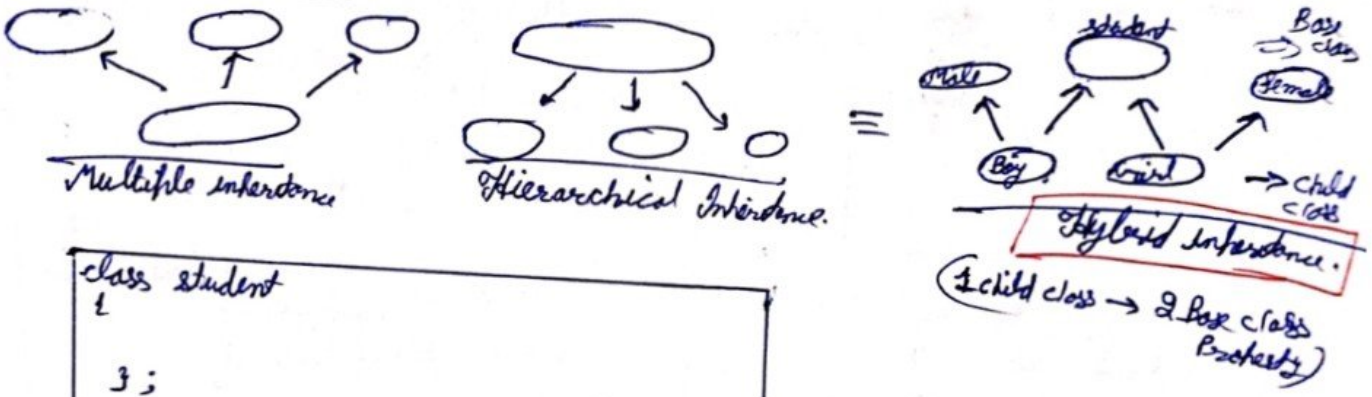


```
class Human
{
   Protected :
   string name ;
   int age ;

   Human(string name , int age)
   { this → name = name ;
     this → age = age ;
   };

class Student : Public Human
{
     Public :
     int roll_no , fees ;
     Student ( string name, int age , int roll_no, int fees): Human (name, age)
     {
          this → name = name ;
          this → age = age ;
          this → rollno = roll_no ;
       } this → fees = fees ;
```

Hybrid Inheritance :



```
class student
{

 };
class Male
{

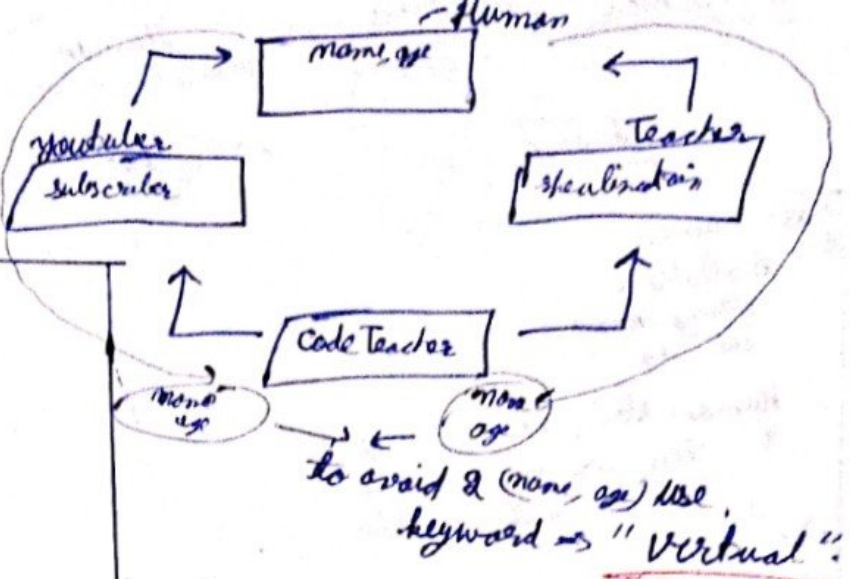
 };
class Female
{

 };
Class Boy : Public student, Public Male
{

 };
class Girl : Public student, Public Female
{

 };
```

Multipath Inheritance



to avoid 2 (name, age) use keyword → "virtual".

```
class human
{
  };
class youtuber : public virtual human
{
};
class Engineer : public virtual human
{
  };
class codeTeacher : public Engineer, public youtuber
{
  };
```

* Polymorphism

Many form

- Compile time
  - Function overloading
  - operation overloading
- Run time

• fn" overloading :

```
class area
{
  public :
    int calculate area (int r)
    { return 3.14 * r * r ; }
    int calculate area (int l, int b)
    { return l * b ; }
};
int main ()
{
    Area A1, A2 ;
    A1. Calculate area (3) ;
    A2. Calculate area (3, 4) ;
}
```

• operation overloading

```
class my complex
{
  int real, img ;
  public :
    my complex ( ) { }
    my complex (int real, int img)
    {
      this → real = real ;
      this → img = img ;
    }
    void display ( )
    {
      cout << real << " + i" << img << endl ;
    }
    my complex operation + (my complex & C)
    {
      my complex ans ;
      ans. real = real + C. real ;
      ans. img = img + C. img ;
      return ans ;
    }
};
int main ( )
{
    my complex C1 (3, 5) ;
    my complex C2 (7, 5) ;
    my complex C3 = C1 + C2 ;
    C3 . display ( ) ;
}.
```

* Virtual

```
class animal
{
  public :
    virtual void speak ( ) :
    { cout << "hehe \n" ; }
};
class dog : public animal
{
  public :
    void speak ( )
    { cout << "bark \n" ; }
};
int main ( )
{
    animal * P ;
    P = new dog ( ) ;
    P → speak ( ) ;
}
```

*P (Pointer Pointing animal class)

P = new dog ( ); ⇒ heap memory

but in run time.

Since virtual hold "P → speak ( );" till the run time not decide output is compile time.

* Pure virtual function :- // Abstract class.

⇒ (virtual void speak ( ) = 0 ;)

⇒ No object form in pure virtual function class.

* Exception Handling :- An exception is an unexpected problem that arises during the execution of a program i.e. our program terminates suddenly with some errors / issues.

Try :- It represent a block of code that may through an exception placed inside the try block.

Catch :- It represent a block of code that is executed when a particular exception is thrown from the try block.

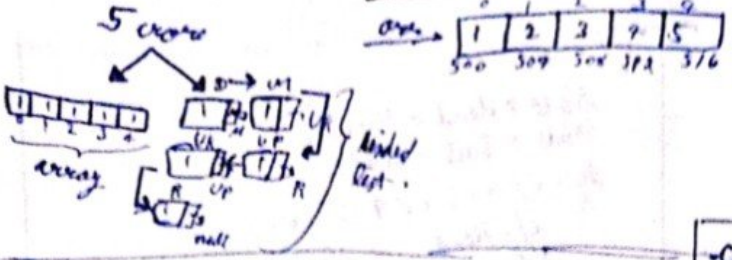
Throw :- An exception in C++ can be thrown using the throw keyword.

```
class customer
{
  string name;
  int balance, acc-no;
  Public
  customer(string name, --- -)
  {
  }
  - - -
  void deposit(int amount)
  {
    if(amount > 0)
    {
      balance += amount;
    } cout << amount;
    else
    {
    } throw "amount should greater then zero";
  } or // throw run-time error("amount should greater then zero");
};
int main()
{
  customer A1("Rohit", 5000, 998);
  try {
    A1.deposit(500);
    A1.deposit(-200);
  }
  catch (const char *e) or // catch (const runtime_error& e)
  {
    cout << "exception occured : " << e << endl;
  }
                                  or // << e.what() << endl;
```

-> The try keyword represents a block of code that may throw an exception placed inside the try block. It's followed by one or more catch blocks. If an exception occurs, try block throw that exception.

```
int main()
{
  int a = 4, b = 0;
  try {
    if (b == 0)
      throw "Divide by 0 is not Possible";
    int c = a/b;
    cout << c << endl;
  }
  catch (const char *e)
  {
    cout << "Exception occured : " << e << endl;
  }
}
```

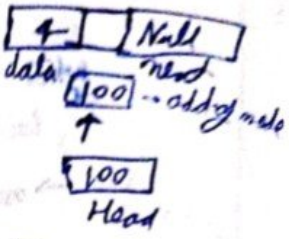
* Linked list



- Insertion.
- Deletion.
- Search.
- Update.

```
class Node
{
  Public:
    int data;
    Node * next;
  Node ( int value)
  {
      data = value;
      next = NULL;
  }; }
int main()
{
    Node * Head
    Head = new Node(4);
}
```

```
class Node
{  Public:
     int data;
   Node *next;
};
int main()
{
   Node * Head;
   Head = new Node();
   Head → data = 4;
   Head → next = Null;
};
```

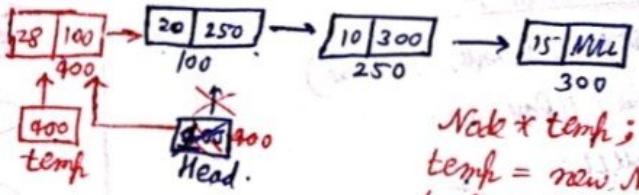


(Dynamic way to create a node)

① Insertion

- start
- end
- Middle.

① start



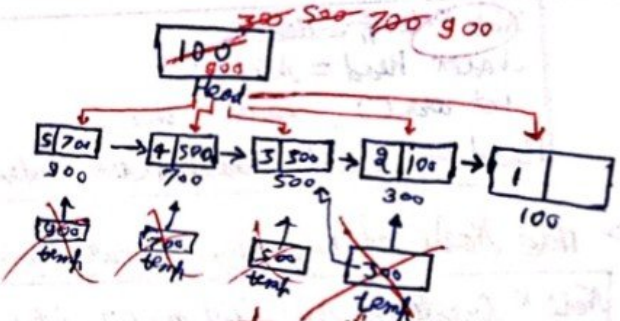
```
Node * temp;
temp = new Node(28);
temp → next = Head;
Head = temp;
```

if linked list does not exist

```
if(Head == Null)
{
  Head = new Node(
}
else
```

```
class Node
{
  Public:
  int data;
  Node * next;
  Node ( int value)
  {
      data = value;
      next = NULL;
  };
int main()
{
    Node * Head;
    Head = NULL;
    int arr[] = {1,2,3,4,5};
    for (int i=0; i<5 ; i++)
    {
        if( Head == NULL)
        {
            Head = new Node(arr[i]);
        }
        else {
            Node * temp;
            temp = new Node (arr[i]);
            temp → next = Head;
            Head = temp;
        }
    }
    // Print values of node.
    Node * temp = Head;
    while (temp != Null)
    {
        cout << temp → data << " ";
    }; temp = temp → next;
}
```

arr 1 2 3 4 5



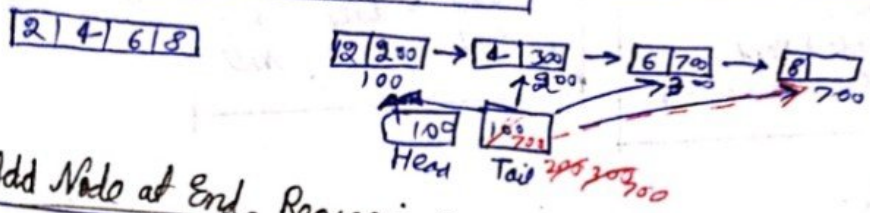
temp will delete automatically after a loop completes because it create static "Node * temp"

but temp = new Node(arr[i]); does not delete because it create dynamically

Q) End :

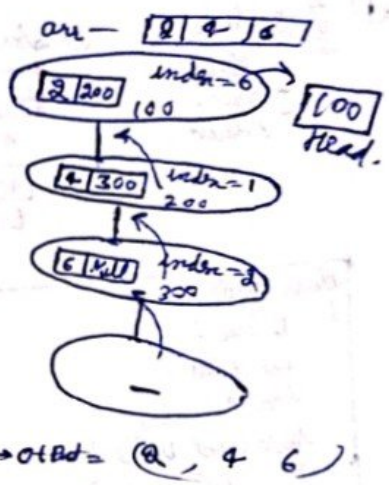
```
int main()
{
  Node * Head = Null;
  for (int i=0; i<4; i++)
  {
    if (Head == NULL))
    {
      Head = new Node(arr[i]);
    }
    else
    {
      Node * tail = Head;
      while (tail -> next != NULL)
        tail = tail -> next;
      tail -> next = new Node(arr[i]);
    }
  }
}
```

```
int main()
{
  Node * Head = NULL;
  Node * tail = NULL;
  for (i=0; i<4; i++)
    if (Head == Null)
    {
      Head = new Node(arr[i])
      tail = Head;
    }
    else
    {
      tail -> next = new Node(arr[i]);
      tail = tail -> next;
    }
}
```



→ Add Node at End, Recursion :-

```
Node * CreateLinkedlist(int arr[], index, int size)
{
    if (index == size) //Base case)
    {
      return NULL;
    };
    Node * temp;
    temp = new Node(arr[index]);
    temp -> Next = CreatedLinkedlist(arr, index+1, size);
    return temp;
}
```

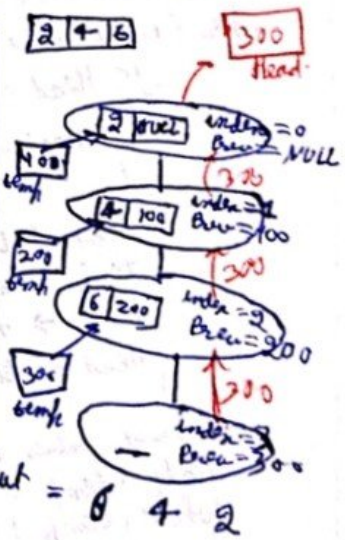


→ Output = (2, 4 6)

```
~~Node * temp = Head~~;
Node* Head = NULL;
int arr[], index, size;
Head = createLinkedlist(arr, index, size);
```

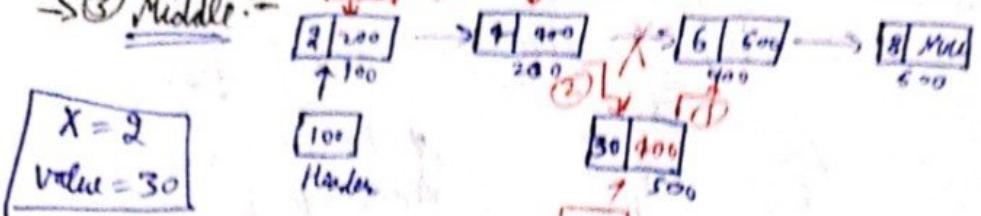
→ Add Node at Beginning, Recursion :-

```
Node * CreateLinkedlist (int arr[], int index, int size, Node* Brev)
{
    if (index == size)
        return prev;
    Node * temp;
    temp = new Node(arr[index]);
    temp -> next = Brev;
    return create linkedlist(arr, index+1, size, temp);
}
```



Output = 6 4 2

→ ③ Middle :-



↳ move (x-1) times

temp

① temp2 → next = temp → next;
② temp → next = temp2;

```
Node * createLinkedList (int arr[], int index, int size)
{
    // Same code as "Add node at End_Recursion".
}
int main()
{
    Node * Head = NULL;
    int arr[] = {1, 2, 3, 4, 5};
    Head = createLinkedList(arr, 0, 5);
    //
    int x = 3;
    int value = 30;
    Node * temp = Head;
    x--;
    while(x--)
    {
        temp = temp → next;
    }
```

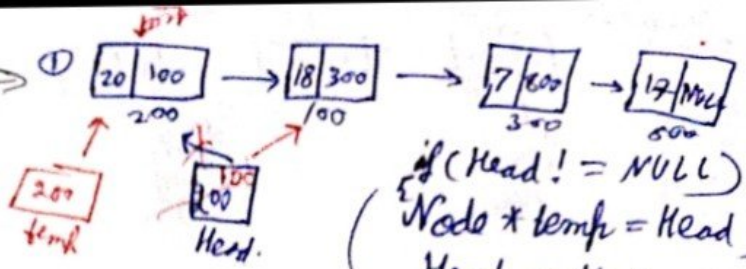
```
Node * temp2 = new Node(value);
temp2 → next = temp → next;
temp → next = temp2;
// Print nodes
temp = Head;
while(temp)
{
    cout << temp → data << " ";
    temp = temp → next;
};
}
```

- Array - static memory → couldn't increase size (use vectors)

  Linked list - Dynamically allotion → could increase size

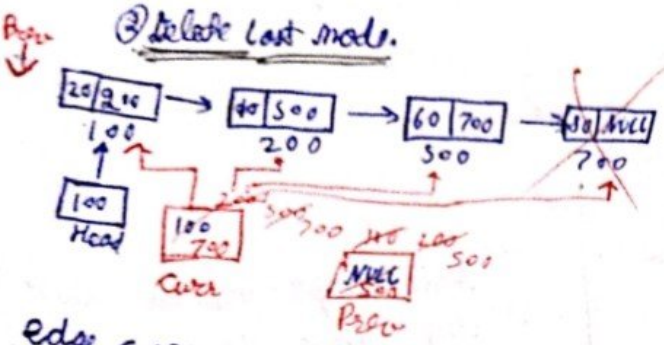
→ Deletion in Singly linked list :-

① Delete first node.
② Delete Last node.
③ Delete Particular node.



```
if (Head != NULL)
{
Node * temp = Head;
Head = Head → next;
delete temp;
}
```

② Delete Last node.



Edge cases :-

① Linked list doesn't exist
(Head != NULL)

② Linked list with only 1 Node.
(Head → next == NULL)

③ Linked list with greater than 1 Node.
(else ⇒ remain code)

```
if(Head != NULL)
{
  if (Head → next == NULL)
  {
    Node * temp = Head;
    Head = NULL;
    delete temp;
  }
  else
  {
    Node * curr = Head;
    Node * Prev = NULL;
    while (curr → next != NULL)
    {
      Prev = curr;
      curr = curr → next;
    }
    delete curr;
    Prev → next = NULL;
  }
}
```

③ Delete a particular Node :-

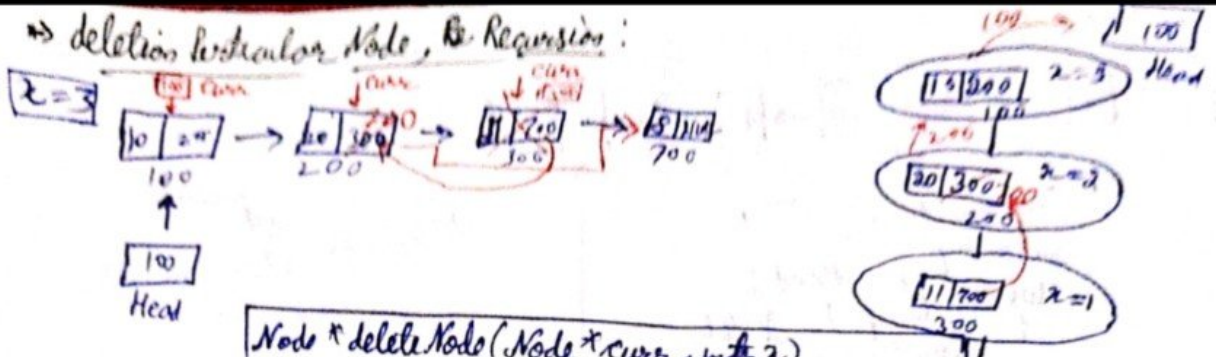
```
if (x == 1)
{
  Node * temp = Head;
  Head = Head → next;
  delete temp;
}
else
{
  Node * curr = Head;
  Node * Prev = NULL;
  x--;
  while (x--)
  {
    Prev = curr;
    curr = curr → next;
  }
  Prev → next = curr → next;
  delete curr;
}
```

Edge cases :-

① At first node.
(x == 1)

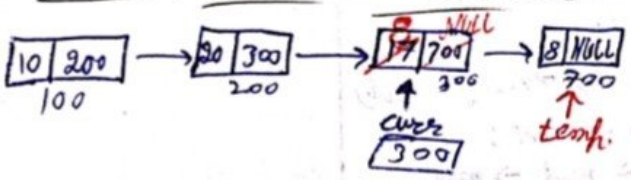
② remaining nodes.
(else ⇒ remain code)

→ deletion Node, By Recursion :



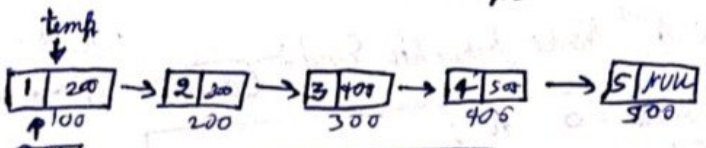
```
Node * deleteNode(Node * curr, int x)
{
    if (x == 1)
    {
        Node * temp = curr → next;
        delete curr;
        return temp;
    }
    curr → next = deleteNode(curr → next, x-1);
    return curr;
}
```

→ delete ~~test~~ Node without Head Pointer :- delete data of Node pointing by curr & curr can't point last Node.



```
Node * temp = curr → next;
curr → data = temp → data;
curr → next = temp → next;
delete temp;
```

→ Reverse linked list



Reverse value :-

```
vector <int> ans;
Node * temp = Head;
while (temp != NULL)
{
    ans.push_back(temp → data);
    temp = temp → next;
}
int i = ans.size() - 1;
temp = Head;
while (temp)
{
    temp → data = ans[i];
    i--;
    temp = temp → next;
}
```

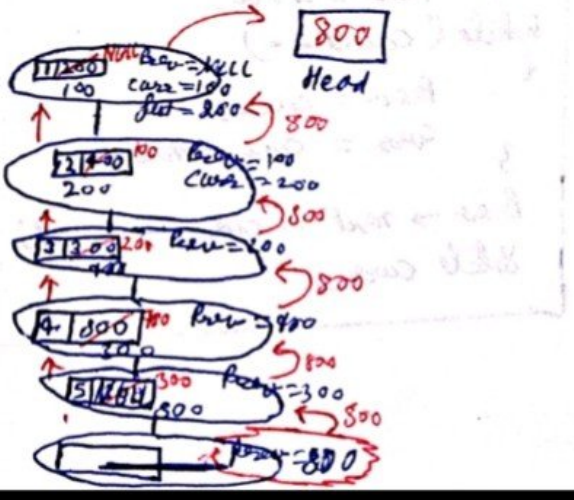
1 2 3 4 5

Reverse whole Node :-

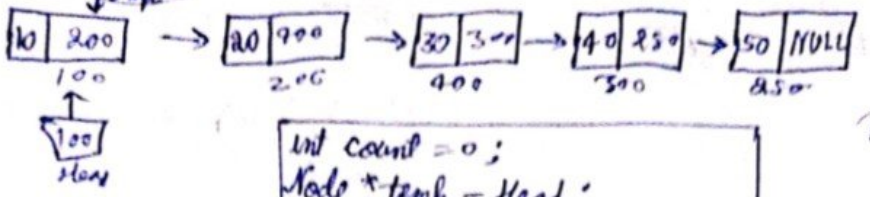
```
Node * curr = Head;
Node * Prev = NULL;
Node * fut = NULL;
while (curr)
{
    fut = curr → next;
    curr → next = Prev;
    prev = curr;
    curr = fut;
}
Head = Prev;
```

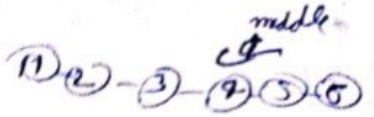
Reverse by recursion →

```
Node * Reverse(Node * curr, Node * Prev)
{
    if (curr == NULL)
        return Prev;
    Node * fut = curr → next;
    curr → next = Prev;
    return Reverse(fut, curr);
}
int main()
{
    Node * Head;
    Head = Reverse(Head, NULL);
}
```



→ Middle of linked list :-





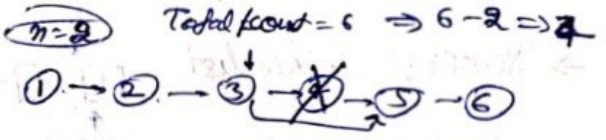
```
int count = 0;
Node * temp = Head;
While (temp != NULL)
{
    count++;
    temp = temp -> next;
}
count /= 2;
temp = Head;
While (count--)
{
    temp = temp -> next;
}
```

- Slow Pointer & fast Pointer :-

```
Node * slow = Head;
Node * fast = Head;
while (fast != NULL && fast -> next != NULL)
{
    slow = slow -> next;
    fast = fast -> next -> next;
}
return slow;
```

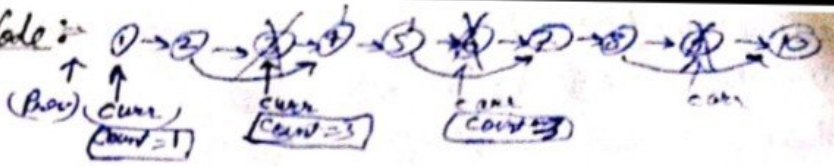
→ Rotate list :-

→ Remove N^{th} Node from the End :- [N :-]



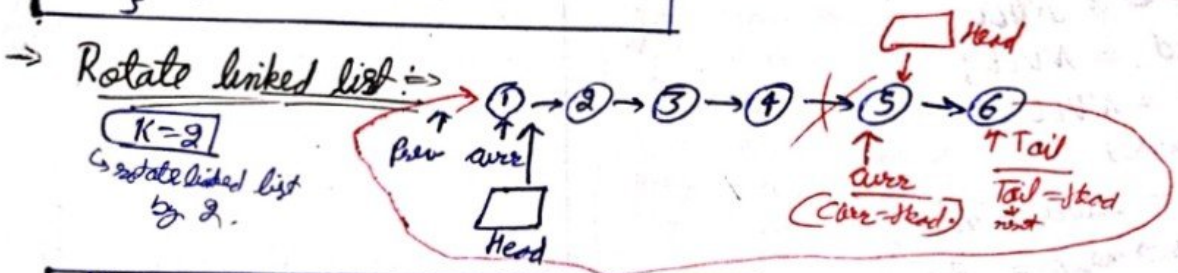
```
int count = 0, n;
Node * temp = Head;
while (temp) // count total no. of Nodes
{
    count++;
    temp = temp -> next;
}
count -= n;
if (count == 0) // (edge case) ⇒ delete first node.
{
    temp = Head
    Head = Head -> next
    delete temp;
}
Node * curr = Head;
Node * Prev = NULL;
while (count--)
{
    Prev = curr;
    curr = curr -> next;
}
Prev -> next = curr -> next;
delete curr;
```

→ Remove Every K^th Node :-



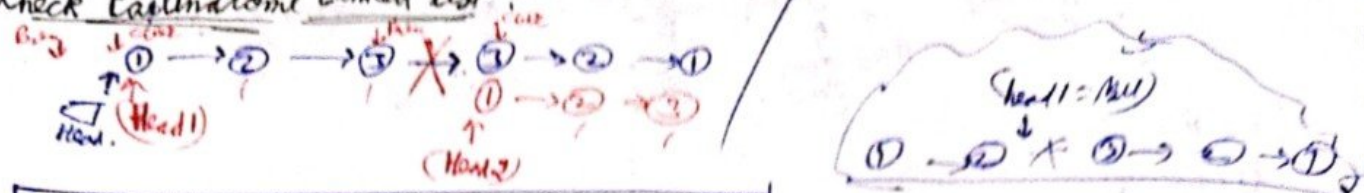
```
int K;
if (k == 1)
    return NULL;
Node *curr = Head, *prev = NULL;
int count = 1;
while (curr)
{
    if (K == count)
    {
        Prev -> next = curr -> next;
        delete curr;
        curr = Prev -> next;
        count = 1;
    }
    else {
        Prev = curr;
        Curr = curr -> next;
        count++;
    }
}
```

→ Rotate linked list :-



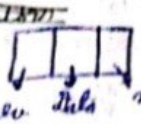
```
if (Head == NULL || Head -> next == NULL) => // edge cases
        return head;
int count = 0;
Node *temp = head;
while (temp)
{
    count++;
    temp = temp -> next;
}
K = K % count;
if (K == 0)          // edge cases
    return head;
count -= K;
Node *curr = head, *prev = NULL;
while (curr--)
{
    Prev = curr;
    curr = curr -> next;
}
Prev -> next = NULL;
Node *tail = curr;
while (tail -> next != NULL)
{
    tail = tail -> next;
}
tail -> next = head;
head = curr;
return head;
```

→ Check Palindrome Linked list :



```
Node * temp = Head;
int count = 0;
while (temp)
{
    count ++;
    temp = temp -> next;
};
count /= 2;
Node * curr = Head;
Node * prev = NULL;
while (count--)
{
    prev = curr;
    curr = curr -> next;
}
prev -> next = NULL;
Node * fut = NULL;
    prev = NULL;
while (curr)
{
    fut = curr -> next;
    curr -> next = prev;
    prev = curr;
    curr = fut;
}
Node * Head1 = Head;
Node * Head2 = prev;
while (Head1)
{
    if (Head1 -> data/val != Head2 -> data/val)
        cout << "Not a Palendrom";
    Head1 = Head1 -> next;
    Head2 = Head2 -> next;
}
    cout << " Linked list is Pallendrom";
```

* Doubly linked list :-

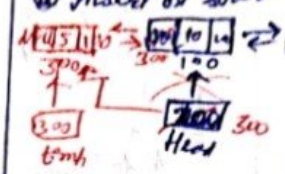


```
class Node
{
    Public :
    int data ;
    Node * next ;
    Node * Prev ;
    Node ( int value )
    {
        data = value ;
        next = NULL ;
        Prev = NULL ;
    } ;
};
```

① Insertion → Insert at Start.
→ Insert at end.
→ Insert at Particular Place.

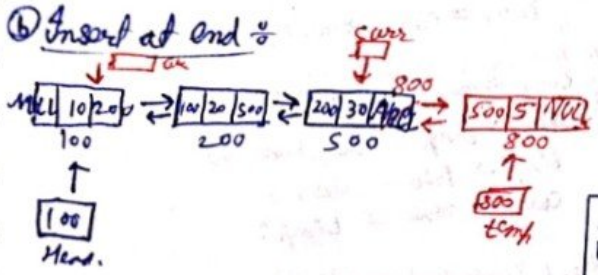
② Deletion

ⓐ Insert at start →



```
if (Head == NVLL)  // if linked list is empty
    Head = new Node (5) ;
else {
    Node * temp = new Node (5) ;
    temp -> next = Head ;
    Head -> Prev = temp ;
    Head = temp ;
}
```

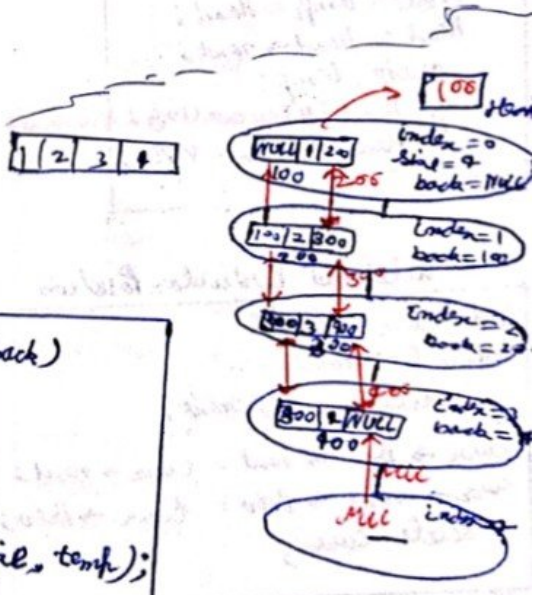
ⓑ Insert at end :-



```
Node * curr = Head ;
while ( curr -> next != null )
    curr = curr -> next ;
Node * temp = new Node (5) ;
curr -> next = temp ;
temp -> Prev = curr ;
```

→ Array to Doubly linked list :- (Insert at end)

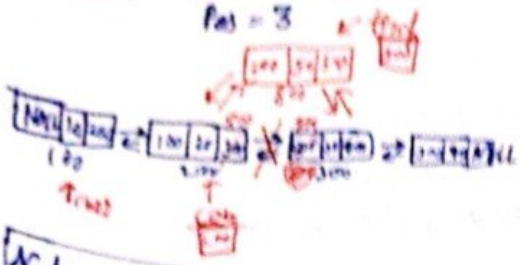
```
Node * Head = NULL ;
Node * Tail = Head ;
for (int i=0 ; i <5 ; i++)
{
    if (Head == NULL)
    {
        Head = new Node (arr[i]) ;
        Tail = Head ;
    }
    else
    {
        Node * temp = new Node (arr[i]) ;
        tail -> next = temp ;
        temp -> prev = Tail ;
        Tail = temp ;
    }
}
```



→ Using Recursion :-

```
Node * CreateDLL (int arr[], int index, int size, Node * back)
{
    if (index == size)
        return NULL ;
    Node * temp = new Node (arr[index]) ;
    temp -> prev = back ;
    temp -> next = CreateDLL (arr, index+1, size, temp) ;
    return temp ;
}
int main ()
{
    Head = CreateDLL (arr, 0, 5, NULL) ;
}
```

Insertion at Particular Node :



```
Node* curr = Head;
while(--Pos)
{
    curr = curr->next;
}
Node* temp = new Node(5);
temp->next = curr->next;
temp->Prev = curr;
curr->next = temp;
temp->next->Prev = temp;
```

edge cases :-

① Insert at start ①

② Insert at End (last Node)

```
int Pos;
if(Pos == 0) // Insert at start ①
{
    if(Head == NULL) // Linked list does not exist
    {
        Head = new Node(6);
    }
    else {
        Node* temp = new Node(6);
        temp->next = Head;
        Head->Prev = temp;
    } Head = temp;
}
else {
    Node* curr = Head;
    // Go to Particular Pos.
    while(--Pos)
    {
        curr = curr->next;
    }
    // Particular Pos is Last Node ②
    if(curr->next == NULL)
    {
        Node* temp = new Node(6);
        temp->Prev = curr;
        curr->next = temp;
    }
    else { // Insert at middle.
        Node* temp = new Node(6);
        temp->next = curr->next;
        temp->Prev = curr;
        curr->next = temp;
        temp->next->Prev = temp;
    }
}
```

★ Deletion :

- at start ①
- at Middle ②
- at End ③

→ delete at start.

```
if(Head != NULL)
{
    Node* temp = Head;
    Head = Head->next;
    delete temp;
    if(Head) // Edge case (only 1 Node exist)
        Head->Prev = NULL;
};
```

→ Delete at End.

```
if(Head != NULL)
{
    if(Head->next == NULL) // only single node exist.
    {
        delete Head;
        Head = NULL;
    }
    else {
        Node* curr = Head;
        while(curr->next)
        {
            curr = curr->next;
        }
        curr->Prev->next = NULL;
    } delete curr;
}
```

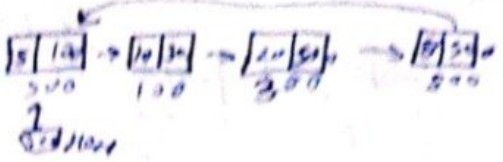
→ Delete at Particular Position

```
Node* curr = Head;
while(--Pos)
{
    curr = curr->next;
}
curr->Prev->next = curr->next;
curr->next->Prev = curr->Prev;
delete curr;
```

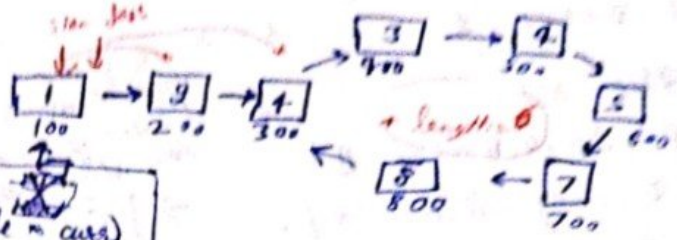
edge cases : delete at first node.
delete at Last node.
⇒ Same code as above → ~~Particular node~~ Particular node.

- Doubly linked list in real life
  → Undo / Redo

→ Circular linked list :



→ Detect Loop in Linked List :

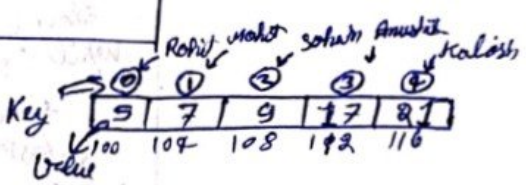


```
bool check (vector <Node *> visited, Node * curr)
{
    for (i = 0; i < visited.size(); i++)        → O(n)
    {
        if (visited[i] == curr)
            return 1;
    }
    return 0;
}

Node * Head = ____;
Node * curr = Head;
vector <Node*> visited;
while (curr != NULL)                            → O(n)
{
    if (check (visited, curr))
        return 1;
    visited.push_back (curr);
    curr = curr -> next;
}
return 0;
```

T.C. → $O(n^2)$

- Unordered maping :



Key	Value
Rohit/0	5
Mohit/1	7
sohan/2	9
Anshit/3	17
Kailash/4	21

- Detect loop.

```
Node * curr = Head;
unordered_map <Node*, bool> visited;
while (curr != NULL)
{
    if (visited[curr] == 1)
        return 1;
    visited[curr] = 1;
    curr = curr -> next;
}
```

→ $O(n)$ = T.C.

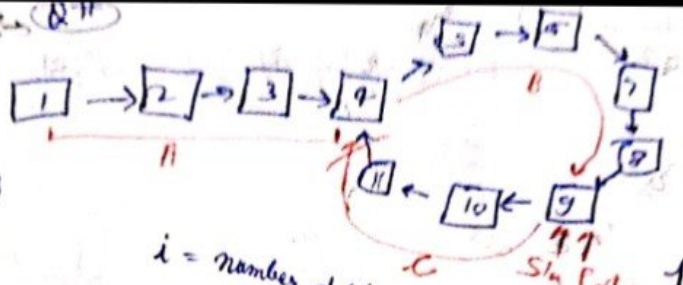
- Fast and Slow Pointer

```
Node * slow = Head;
Node * fast = Head;
while (fast != NULL && fast -> next != NULL)
{
    slow = slow -> next;
    fast = fast -> next -> next;
    if (slow == fast)
        return 1; // cout << "loop exist";
}
```

→ length of loop :

```
Node *slow = Head, *fast = Head;
while (fast != NULL && fast -> next != NULL)
{
    slow = slow -> next;
    fast = fast -> next -> next;
    if (slow == fast)
        break;
}
if (fast == NULL || fast -> next == NULL)
    return 0; // "loop does not exist"
int count = 1;
slow = fast -> next;
while (slow != fast)
{
    count++;
    slow = slow -> next;
}
cout << count;
}
```

→ Remove loop in Linked list :- (Q 141)



Mathematical Proof :-

Slow dist :- $A + (B+C)i + B$

Fast dist :- $A + (B+C)j + B$

Fast dist = 2 Slow dist.

$A + (B+C)*j + B = 2A + 2(B+C)*i + 2B.$

$A + B = (B+C)*j - 2(B+C)*i.$

$A + B = (B+C)*(j - 2i)$

$A + B = T * (B+C)$

$T \neq 1,$

$T = 2, 3, 9,$

($T = 2$) $A + B = 2(B+C)$

$A = (B+C) + B$

($T = 3$) $A = 2(B+C) + B$

i = number of times slow iterate the loop.

j = number of times fast iterate the loop.

→ $j > 2i$

fast slow

1. - loop detect.
2. Slow = Head.
3. Starting of loop.

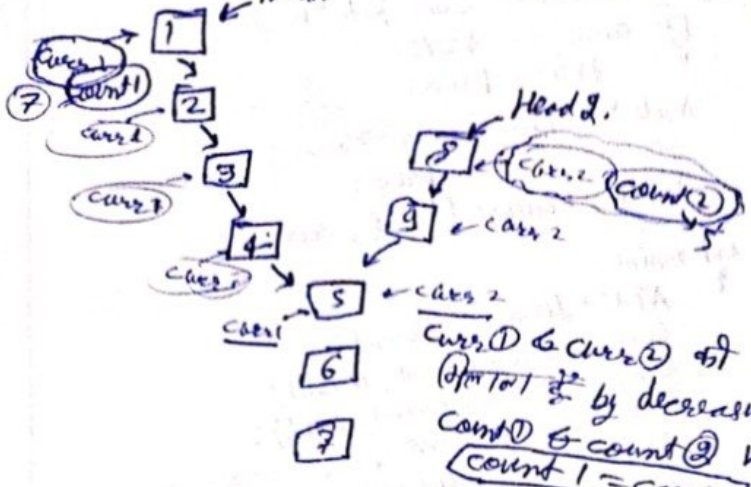
```
Node *slow = Head, *fast = Head;
while(fast != NULL && fast -> next != NULL)
{
    slow = slow -> next;
    fast = fast -> next -> next;
    if(slow == fast)
        break;
}
if(fast == NULL || fast -> next == NULL)
    return;
slow = head;
while(slow != fast)
{
    slow = slow -> next;
    fast = fast -> next;
}
while(slow -> next != fast)
{
    slow = slow -> next;
}
slow -> next = NULL;
```

(M2)

1. loop detect
2. find number of nodes in loop.
3. slow = Head, fast = slow + no of nodes
4. iterate fast to meet Head
5. break the loop.

Insertion Point in Y Shaped Linked list

#8



curr① & curr② ko by decreasing count① & count② when count 1 = count 2 curr① & curr② ki same position

```
Node * curr1 = Head1, * curr2 = Head2;
int count1 = 0, count2 = 0;
while (curr1)
{
    count1++;
    curr1 = curr1 → next;
}
while (curr2)
{
    count2++;
    curr2 = curr2 → next;
}
curr1 = Head1, curr2 = Head2;
while (count1 > count2)
{
    curr1 = curr1 → next;
    count1--;
}
while (count2 > count1)
{
    curr2 = curr2 → next;
    count2--;
}
while (curr1 != curr2)
{
    curr1 = curr1 → next;
    curr2 = curr2 → next;
}
if (curr1 == Null)
    return -1;
return curr → data;
```

Alternate sol^n

① *Tail, Head 1 ka.

② Loop ka starting Head ① Pointer.

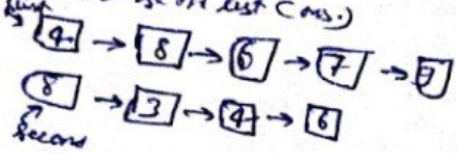
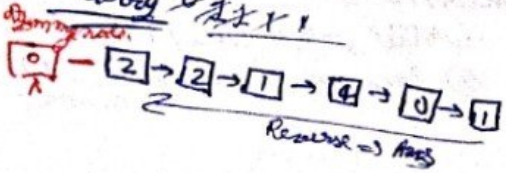
9 7 6 8 4
6 4 3 8
1 0 8 1 2 2

① Reverse both linked list.
② Addition
③ Reverse the list (ans.)



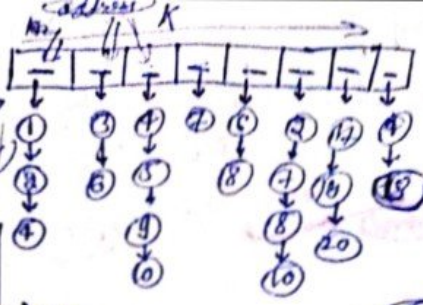
Carry 0 आया !



```
//Reverse the Node
Node *Reverse(Node *curr, Node *prev)
{
    if(curr == NULL)
        return prev;
    Node *front = curr->next;
    curr->next = prev;
    return Reverse(front, curr);
}
int main()
{
    Node *first, *second;
    first = Reverse(first, NULL);
    second = Reverse(second, NULL);
    Node *curr1 = first, *curr2 = second;
    Node *Head = new Node(0); //Dummy node
    Node *Tail = Head;
    int carry = 0, sum;
    while(curr1 && curr2)
    {
        int sum = curr1->data + curr2->data + carry;
        Tail->next = new Node(sum % 10);
        Tail = Tail->next;
        curr1 = curr1->next;
        curr2 = curr2->next;
        carry = sum / 10;
    }
    while(curr1)
    {
        int sum = curr1->data + carry;
        Tail->next = new Node(sum % 10);
        Tail = Tail->next;
        curr1 = curr1->next;
        carry = sum / 10;
    }
    while(curr2)
    {
        int sum = curr2->data + carry;
        Tail->next = new Node(sum % 10);
        Tail = Tail->next;
        curr2 = curr2->next;
        carry = sum / 10;
    }
    while(carry)
    {
        Tail->next = new Node(carry % 10);
        carry /= 10;
    }
    Head = Reverse(Head->next, NULL);
    return Head;
}
```

→ Merge K Sorted linked list :-

(Node* arr[K]) ⇒ arr



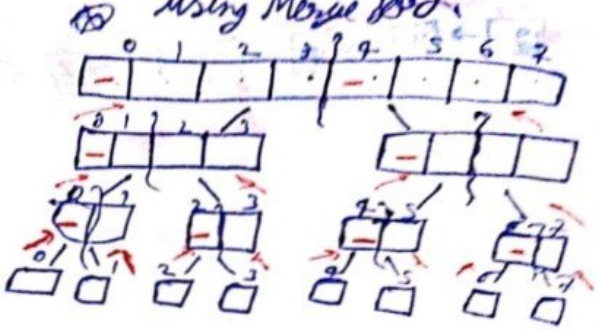
```
class Node
{ Public:
  int data;
  Node *next;
};
```

M1

```
// Merge fn same as previous question
Node* Head = arr[0];
for (i=1; i<k; i++)
{
   Head = merge (Head, arr[i]);
}
return Head;
```

→ T.C ⇒ $T(NK^2)$

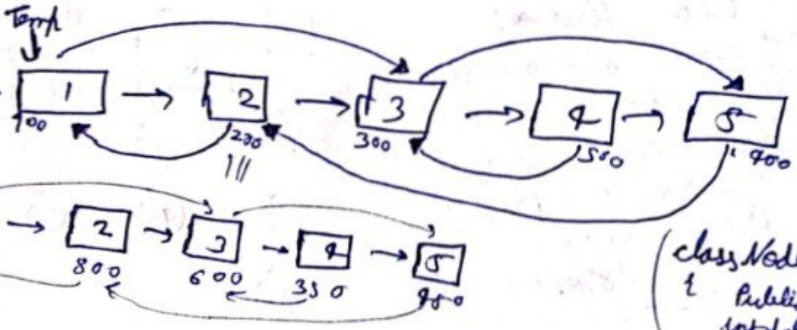
M2 Using Merge sort :-



```
void Mergesort (Node *arr[], int start, int end)
{
   if (start >= end)
      return;
   int mid = start + (end - start)/2;
   mergesort (arr, start, mid); // left
   mergesort (arr, mid+1, end); // Right
   arr[start] = merge (arr[start], arr[mid+1]);
}
```

⇒ T.C. → $O(KN\log K)$

→ Clone a linked list :-



steps :-
1. create all nodes without random pointers.
2. Assign random pointers from start.

```
class Node
{ Public:
  int data;
  Node *next, *arb;
};
```

→ find fxn

```
Node* find (Node* curr1, Node* curr2, Node* x)
{
   if (x == NULL)
      return NULL;
   while (curr1 != x)
   {
      curr1 = curr1->next;
      curr2 = curr2->next;
   }
   return curr2;
}
```

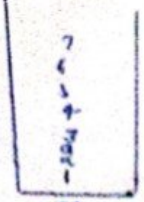
Time complexity :- $O(n^2)$

```
Node *Headcopy = new Node (0);
Node *tailcopy = Headcopy;
Node *temp = Head;
while (temp)
{
   Tailcopy->next = new Node (temp->data);
   Tailcopy = Tailcopy->next;
   temp = temp->next;
}
Tailcopy = Headcopy;
Headcopy = Headcopy->next;
delete Tailcopy;
Tailcopy = Headcopy;
temp = Head;
while (temp)
{
   Tailcopy->arb = find (Head, Headcopy, temp->arb);
   Tailcopy = tailcopy->next;
   temp = temp->next;
}
return Headcopy;
```

Create duplicate linked list

O(n) O(n) O(n)

Stack



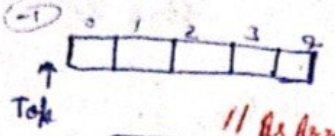
Stack

- It is a linear data structure, in which insertion & deletion only allowed at the end, called the top of stack
- When we define stack as an Abstract data type then we are only interested in knowing the stack operation from user POV.
  If it simply means, we are not intrested in knowing the details, we only intrested in what type of o/p we can perform.

Operations on Stack :

Pop :
Push :
Top/Peek :
isSize :
isEmpty :

Last in first out LIFO



First in first out
First in Last out
Last in Last out
Last in first out

// As Array

```
class Stack
{
    int *arr;
    int size;
    int top;
  Public :
bool flag ;
// Constructor
Stack (int s)
{
    size = s;
    top = -1;
    arr = new int[s];
  } flag = 1;

    // Push
void Push(int value)
{  if (top == size - 1)
    {
        cout << "Stack overflow \n";
        return;
    }
    else {
    top ++;
    arr[top] = value;
    cout << "Pushed" << value << "in Stack";
} } flag = 0
```

```
    // Pop
void Pop()
{   if(top == -1)
        cout << "Stack Underflow
    Else
    {  cout << "Popped" << arr[top]
            << From the Stack \n"
    top --;
    if(top == -1).
} } flag = 1;
    // Peek
int peek()
{   if(top == -1)
    {  cout << "Stack empty";
       return -1;
    }
    else
    {
} } return arr[top];
    // IsEmpty
bool IsEmpty()
{   return top == -1;
} // Is Size
int IsSize()
{   return top + 1;
};
```

// As Linked list.

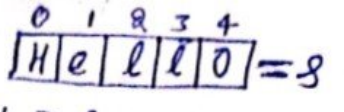
```
class Node
{
    // Same code to create node.
};
class Stack {
{   Node * Top;
    int size;
    Public :
    Stack ()
    {   Top = NULL;
        size = 0;
    }
void Push(int value)
{  Node * temp = new Node(value);
   temp -> next = Top;
   Top = temp;
     size++;
}
Void Pop()
{ if(Top == NULL)
  {  cout << "Stack Underflow";
  }
  else
  {
    Node * temp = Top;
    Top = Top -> next;
    delete temp;
} }
int Peek()
{ if(top == NULL)
  {  cout << "Stack is empty";
     return -1;
  }
  else {
     return top -> data;
  }
};
```

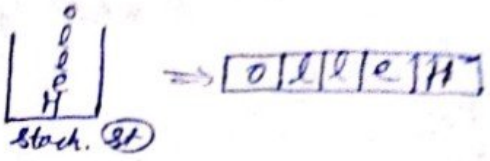
STL

→ implementation as "deque."

```
stack<int> s;
s.push(5);
s.push(6);
s.pop();
cout<<s.top;
```

- Reverse array :

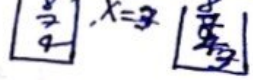




```
vector<char> s;
stack<char> st;
for(int i=0; i<s.size(); i++)
{
    st.push(s[i]);
}
int i=0;
while(!st.empty())
{
    s[i] = st.top();
    i++;
    st.pop();
}
```

→ TC ⇒ O(n)
SC ⇒ O(n)

- Insert at bottom :

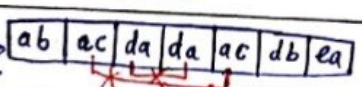


```
stack<int> st;
int x;
```

TC = O(n)
S.C. = O(n)

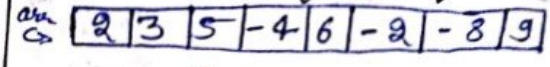
```
stack<int> temp;
while(!st.empty())
{
    temp.push(st.top());
    st.pop();
}
st.push(x);
while(!temp.empty())
{
    st.push(temp.top());
    temp.pop();
}
return st;
```

- String Manipulation :



```
stack<string> s;
for(i=0; i<v.size(); i++)
{
    if(s.empty())
        s.push(v[i]);
    else if(s.top() == v[i])
        s.pop();
    else
        s.push(v[i]);
}
return s.size();
```

- Make the array beautiful



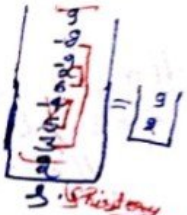
2 3 5 -4 6 -2 -8 9 (different)

2 3 -4 6 -2 -8 9

2 -8 9

stack neg

2 9



```
stack<int> s;
for(i=0; i<arr.size(); i++)
{
    if(s.empty())
        s.push(arr[i]);
    else if(arr[i] >= 0)
        if(s.top() >= 0)
            s.push(arr[i]);
        else
            s.pop();
    else // arr[i] <= 0 (-ve)
        if(s.top() < 0)
            s.push(arr[i]);
        else
            s.pop();
}
vector<int> ans(s.size());
int i = s.size() - 1;
while(!s.empty())
{
    ans[i] = s.top();
    i--;
    s.pop();
}
return ans;
```

- Parenthesis is valid or not

str = (((())())) → valid

```
bool check(string str)
{
    stack<char> s;
    for(i=0; i<str.size(); i++)
    {
        if(str[i]=='(')
            s.push(str[i]);
        else
        {
            if(s.empty())
                return 0;
            else
                s.pop();
        }
    }
    return s.empty();
}
```

→ T.C. = O(n)
→ S.C. = O(n)

```
bool check(string str)
{
    int left=0;
    for(i=0; i<str.size(); i++)
    {
        if(str[i]=='(')
            left++;
        else
        {
            if(left==0)
                return 0;
            else
                left--;
        }
    }
    return left==0;
}
```

→ T.C. = O(n)
S.C. = O(1)

- Minimum add to make Parenthesis valid

str =))((⇒ 2

```
stack<char> st;
int count=0;
for(i=0; i<s.size(); i++)
{
    if(s[i]=='(')
        st.push(s[i]);
    else
    {
        if(st.empty())
            count++;
        else
            st.pop();
    }
}
return count+st.size();
```

- Valid Parentheses :

s = ([]) {} [()]

st.

```
stack<char> st;
for(i=0; i<s.size(); i++)
{
    if(s[i]=='('||s[i]=='{'||s[i]=='[')
        st.push(s[i]);
    else
    {
        if(st.empty())
            return 0;
        else if(s[i]==')')
        {
            if(st.top()!='(')
                return 0;
            else
                st.pop();
        }
        else if(s[i]=='}')
        {
            if(st.top()!='{')
                return 0;
            else
                st.pop();
        }
        else
        {
            if(st.top()!='[')
                return 0;
            else
                st.pop();
        }
    }
}
return st.empty();
```

- Print Bracket Number :

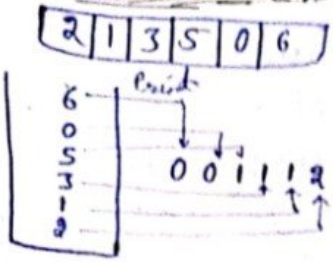
s = (aa(bdc))P(de) → 3

count = 0 1 2 3

ans = 1 2 2 1 3 3

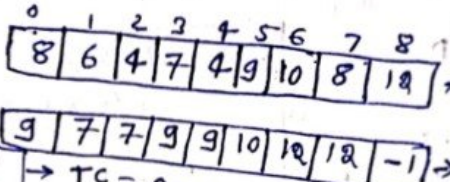
```
string s;
int count=0;
stack<int> st;
vector<int> ans;
for(i=0; i<s.size(); i++)
{
    if(s[i]=='(')
    {
        count++;
        st.push(count);
        ans.push_back(count);
    }
    else if(s[i]==')')
    {
        ans.push_back(st.top());
        st.pop();
    }
}
return ans;
```

Get Minimum at pop :



```
int arr[];
int size;
stack<int> st;
for(int i=0; i<n; i++)
{
    if(i==0)
        st.push(arr[i]);
    else
        st.push(min(arr[i], st.top()));
}
// print stack.
```

→ Next Greater Element :-



(M1) brute force :

```
vector<int> ans(n,-1);
for(i=0; i<n; i++)
{
    for(j=i+1; j<n; j++)
    {

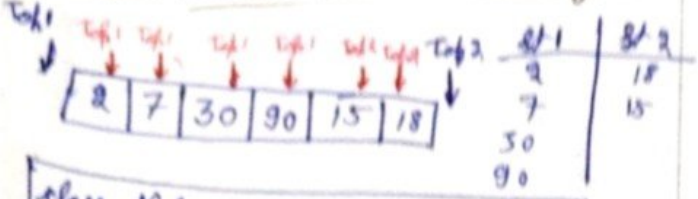
T.C. ⇒ O(n)

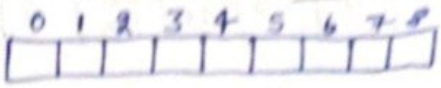
Implement two stack in an array



st 1	st 2
2	18
7	15
30	
90	

```
class NStack
{
    Public:
    int *arr;
    int top1, top2;
    int size;
    NStack (int n)
    {
        size = n;
        arr = new int[n];
        top1 = -1;
        top2 = n;
    }
    void push1(int x)
    {
        if (top1+1 == top2)
            return;
        top1++;
        arr[top1] = x;
    }
    void push2(int x)
    {
        if (top2-1 == top1)
            return;
        top2--;
        arr[top2] = x;
    }
    int pop1()
    {
        if (top1 == -1)
            return -1;
        int elem = arr[top1];
        top1--;
        return element;
    }
    int pop2()
    {
        if (top2 == size)
            return -1;
        int element = arr[top2];
        top2++;
        return element;
    }
```

N stack in an array.



Let stack = 3 space = 9

store top indexes (modify)

(Top is a ptr which is pointing to a ptr (index) store Node type values)

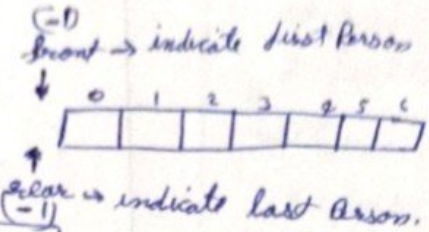
```
// Create Node (same as linked list)
class Node
{
    Public:
    int index;
    Node* next;
    Node (int x)
    {
        index = x;
        next = NULL;
    }
};
class NStack
{
    Public:
    int *arr; // store original data
    Node **Top; // Top element's index of particular stack
    stack<int> st; // Empty indexes (store)
    NStack (int N, int S) // size of array S
    {
        arr = new int[S];
        Top = new Node*[N];
        for(i=0; i<N; i++)
            Top[i] = NULL;
        for(i=0; i<S; i++)
            st.push(i);
    }
    bool push (int x, int m)
    {
        if st.empty())
            return 0;
        arr[st.top()] = x;
        Node *temp = new Node(st.top());
        temp -> next = Top[m-1];
        Top[m-1] = temp;
        st.pop();
        return 1;
    }
    int Pop()
    {
        if (Top[m-1] == NULL)
            return -1;
        st.push = Top[m-1] -> index;
        int element = arr[Top[m-1] -> index];
        Top[m-1] = Top[m-1] -> next;
        return element;
    };
```

queue →

FCFS (first in first out)

Operations in queue
1. Push
2. Pop
3. front
4. isfull
5. isEmpty

→ Implementation queue using Array:-



```
class queue
{
  int * arr;
  int front, rear;
  int size;
  Public:
  Queue (int n)
  {
    arr = new int[n];
    front = -1; rear = -1;
    size = n
  }
  bool IsEmpty()
  {
    return front == -1;
  }
  bool IsFull()
  {
    return rear == size-1;
  }
  void push (int x)
  {
    if (IsEmpty())
    {
      front = rear = 0;
      arr[0] = x;
    }
    else if (IsFull())
    {
      cout << "Queue Overflow";
      return;
    }
    else
    {
      rear = rear + 1;
      arr[rear] = x;
    }
  }
  void Pop()
  {
    if (IsEmpty())
    {
      cout << "Queue Underflow";
      return;
    }
    else
    {
      if (front == rear)
        front = rear = -1;
      else
        front = front + 1;
    }
  }
  int stack()
  {
    if (IsEmpty())
    {
      cout << "Queue is Empty";
      return -1;
    }
    else
      return arr[front];
  }
};
```

⇒ Circular Queue as array:

- front = (front + 1) % size;
- rear = (rear + 1) % size;

circular Queue.

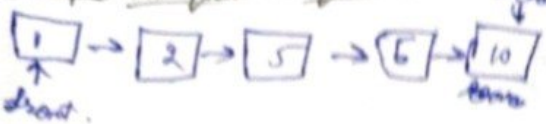
⇓

return (rear + 1) % size == front;

rear = (rear + 1) % size;

front = (front + 1) % size.

→ Implement queue using linked list



```
class Node {
    // create linked list
    code;
};

class Queue
{
    Node* front;
    Node* rear;
    Public:
    Queue ()
    {
      front = rear = NULL;
    };
    bool IsEmpty()
    {
      return front == NULL;
    }
    void Push (int x)
    {
        if( Is Empty())
        {
            front = new Node (x);
            rear = front;
        } return;
        else
        {
            rear -> next = New Node (x);
        } rear = rear -> next;
    }
    void Pop ()
    {
        if (Is Empty())
        {
            cout << "Queue Underflow";
            return;
        }
        else
        {
            Node * temp = front
            front = front -> next;
        } } delete temp;

    int start ()
    {
        if (Is Empty())
        {
            cout << "Queue is Empty";
            return -1;
        }
        else
        {
            return front -> data;
        }
    }
```

→ STL : Queue

① Push
② Pop
③ Size
④ front
⑤ Empty.
⑥ back.

```
queue <int> q;
q. Push (5);
q. Pop ();
```

→ Print all element in queue :→

q → | 2 | 4 | 6 | 3 | 5 |

Approach 1

```
Vector<int> ans;
while(!q.empty())
{
  cout << q.front();
  ans.Push_back(q.front());
}q.Pop();
for(i=0; i<ans.size(); i++)
    q.push(ans[i]);
```

Approach 2

```
int n = q.size();
while(n--)
{
  cout<<q.front();
  q.push(q.front());
}q.pop();
```

→ Reverse first K element of queue:

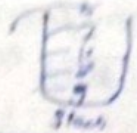
3	7	10	13	8	5	4
0	1	2	3	13	8	5	4

① Push first K element of queue in stack.
② Store the size of remain queue.(n)
③ Push all element of stack into queue.
④ Push first n element of queue at last.

```
stack<int> st;
while(k--)
{
   st.push(q.front())
   q.Pop();
}
int n = q.size();
while((st.empty()))
{
    q.push(st.top());
    st.pop();
}
while(n--)
{
    q.push(q.front());
}  q.pop();
```

→ Queue Reversal:

9	8	11	7	5



```
stack int > st;
while(!q.empty())
{
   st.push(q.front());
   q.pop();
}
while(!st.empty())
{
   q.push(st.top());
   st.pop();
}
```

→ Time needed to buy tickets :→

0	1	2	3	4
1	5	2	3	7

Ticket[i] — K=2 — i — j — ticket

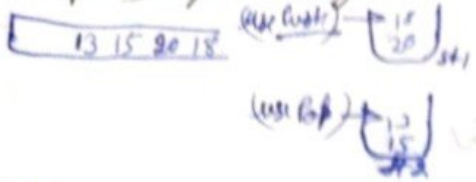
K=2
Time need to buy all ticket for person ②.
He need 2 (ticket)

1 sec for 1 ticket.
1 ticket to 1 Person at a time

① Push all index in queue.
② Time = 0 sec;
③ Give ticket & Push to back by subtract 1 (ticket--)
④ Time = increase by 1/
⑤ Ticket requirement which is required more ticket.

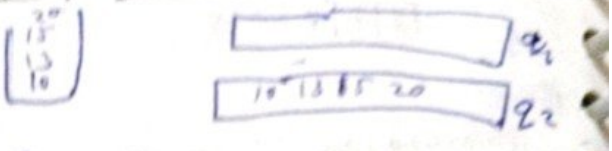
```
queue<int> q; //n = ticket.size();
for(i=0; i<n; i++)
    q.push(i);
int time =0;
while(Ticket[k]!=0)
{
    Ticket[q.front()]--;
    if(Ticket[q.front()])
        q.push(q.front());
q.Pop()
   Time++;
}
return Time;
```

→ Implement queue using stack :-



```
class Queue
{
    stack<int> st1;
    stack<int> st2;
public:
bool empty()
{
return st1.empty() && st2.empty();
void push(int x)
{
    st1.push(x);
int pop()
{
    if(empty())
        return 0;
    if(!st2.empty())
    {
        int element = st2.top();
        st2.pop();
        return element;
    }
    else
    {
        while(!st1.empty())
        {
            st2.push(st1.top());
            st1.pop();
        }
        int element = st2.top();
        st2.pop();
        return element;
    }
}
int peek()
{
    if(empty())
        return 0;
    if(!st2.empty());
        return st2.top();
    else
    {
        while(!st1.empty())
        {
            st2.push(st1.top());
            st1.pop();
        }
        return st2.top();
    }
};
```

→ Implement stack using queue :-



Push → Jo queue exist karti ho

Pop → Jis queue me order element ka sahi ho (shift to another queue & delete last element)

```
class stack
{
    queue<int> q1;
    queue<int> q2;
public:
bool empty()
{
    return q1.empty() && q2.empty();
void push(int x)
{
    if(empty())
        q1.push(x);
    else if(q1.empty())
        q2.push(x);
    else
        q1.push(x);
int pop()
{
    if(empty())
        return 0;
    else if(q1.empty())
    {
        while(q2.size()>1)
        {
            q1.push(q2.front());
            q2.pop();
        }
        int element = q2.front();
        q2.pop();
        return element;
    }
    else
    {
        while(q1.size()>1)
        {
            q2.push(q1.front());
            q1.pop();
        }
        int element = q1.front();
        q1.pop();
        return element;
    }
int top()
{
    if(empty())
        return 0;
    else if(q1.empty())
        return q2.back;
    else
        return q1.back;
```

→ Print all number in every window of size K →

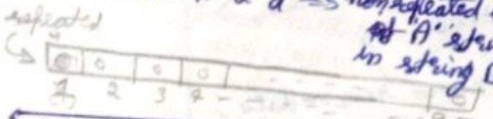
0	1	2	3	4	5
3	6	2	7	8	11

① Push that index element
② Print the queue.
③ Pop.

```
void display(queue<int> q)
{
    while (!q.empty())
    {
        cout << q.front() << " ";
        q.pop();
    }
    cout << endl;
}
queue < int > q
for (i=0; i<k-1; i++)
    q.push(arr[i]);
for(i=k-1; i<n; i++)
{
    q.push(arr[i]);
    display(q);
    q.pop();
}
```

→ first non repeating char in a stream of character.

A = "a b a b d c"
B = "a a b # d d" → first non repeated char of A' string placed in string B.



```
string B = "";
vector<int> repeated(26,0)
queue < char > q;
for (i=0; i<A.size(); i++)
{
    if (repeated[A[i]-'a']>=1)
        repeated[A[i]-'a']++;
        while(!q.empty() && repeated
                [q.front()-'a']>1)
            q.pop();
        if (q.empty())
            B += '#';
        else
            B += q.front();
    else {
        repeated[A[i]-'a']++;
        q.push(A[i]);
    }
```

→ first negative integer in every window of size k

A → | 2 | -3 | -4 | -2 | 7 | 8 | 9 | -10 |

-3 -3 -4 -2 0 -10

① Push the element in queue
② Print first negative element in queue.
③ Pop.

(M1)

```
queue<int> q
for (i=0; i<k-1; i++)
    q.push(A[i]);
vector<int> ans;
for(i=k-1; i<n; i++)
{
    q.push(A[i]);
    ans.push_back(display(q));
    q.pop();
}
return ans.
```

```
int display(queue<int> q)
{
    while (!q.empty())
    {
        if (q.front() < 0)
            return q.front();
        q.pop();
    }
    return 0;
}
```

(M2)

2	-3	-4	-2	7	8	9	-10

store indexes of -ve number in queue of array

① Push -ve num. indexes
② Pop the first element if number index of queue < k
③ Print first -ve num.

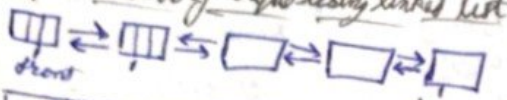
```
queue<int> q;
for(i=0; i<k-1; i++)
{
    if (A[i] < 0);
        q.push(i);
}
vector<int> ans;
for (i=k-1; i<n; i++)
{
    if (A[i] < 0)
        q.push(i);
    if (q.empty())
        ans.push_back(0);
    else
    {
        if(q.front() <= i-k)
            q.pop();
        if(q.empty())
            ans.push_back(0);
        else
            ans.push_back(A[q.front()]);
    }
}
return ans;
```

```
while(repeated[q.front()-'a']>1)
{
    q.pop()
}
B += q.front();
}
return B;
```

→ Dequeue :-

1. push - front.
2. push - back.
3. pop - front.
4. pop - back.
5. start.
6. end.

→ Implementation of Dequeue using linked list.

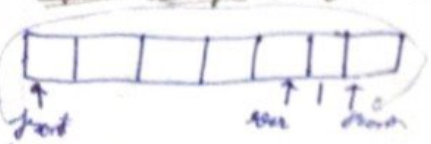


```
class Node
{
};// create a dubly linked list
class Dequeue
{
  Node *front, *rear;
  Public:
  Dequeue()
    { front = rear = NULL;
    }
  Push - front (int x)
  { if (front = NULL)
      { front = rear = new Node (x);
      } return ;
    else
      { Node *temp = new Node (x);
        temp -> next = front;
        front -> Prev = temp;
        front = temp;
      } return ;
  }
  void push - back (int x)
  {
    if (front = = NULL)
      { front = rear = new Node (x);
      } return ;
    else
      { Node *temp = new Node (x);
        rear -> next = temp ;
        temp -> Prev = rear;
        rear = temp;
      } return ;
  }
  void pop - front ()
  {
    if (front = = NULL)
    { cout << "queue underflow";
      } return ;
    else
      { Node *temp = front;
        front = front -> next;
        delete temp;
        if (front)
          front -> prev = NULL;
        else
          } rear = NULL;
  }
```

```
void pop - back()
{
    if (front = = NULL)
        return ;
    else
      { Node* temp = rear;
        rear = rear -> prev;
        delete temp;
        if (rear)
            rear -> next = NULL;
        else
  } }     front = NULL;

int start ()
{
    if (front = = NULL)
        return -1;
    else
        return front -> data;
}
int end ()
{
    if (front = = NULL)
        return -1;
    else.
        return rear -> data ;
  }
};
```

⇒ Implement Dequeue Using Array



↳ make circular array:

- front = (front + 1) % size ; (for pop front)
- front = (front - 1 + size) % size ;
  ↳ for pop back when front is at 0
- full ⇒ front == (rear + 1) % size .

```
class Dequeue
{
    int front, rear, size;
    int * arr ;
    public :
    Dequeue (int n)
    {
       size = n;
       arr = new int [n];
       front = rear = -1;
    }
    bool IsEmpty()
    {
       return front == -1;
    }
    bool IsFull ()
    {
       return (rear+1) % size == front;
    }
    void push_front (int x)
    {
        if ( IsEmpty() )
        {
            front = rear = 0;
            arr[0] = x;
        } return ;
        else if ( IsFull() )
        {
            return ;
        }
        else
        {
            front = (front - 1 + size) % size;
            arr[front] = x;
        } return ;
    }
    void push_back (int x)
    {
        if ( IsEmpty() )
        {
            front = rear = 0;
        } arr [0] = x;
        else if ( IsFull() )
        {
            return ;
        }
        else
        {
            rear = (rear+1) % size ;
            arr [rear] = x
        } return ;
```

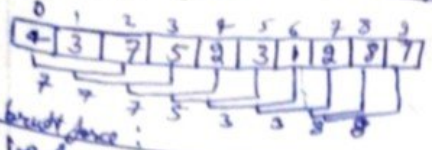
```
    void pop_front ()
    {
        if (IsEmpty ())
            return ;
        else
        {
            if (front == rear)
                front = rear = -1;
            else
                front = (front + 1) % size;
        }
    }
    void pop_back ()
    {
        if ( IsEmpty())
            return;
        else
        {
            if (front == rear)
                front = rear = -1;
            else
                rear = (rear - (+ size)) % size;
        }; }
    int start ()
    {
        if ( IsEmpty ())
            return -1;
        else
            return arr [front];
    }
};
```

⊛ STL :- `#include <deque>`

```
deque <int> d;
d. push_back (x);
d. push_front (x);
d. pop_front ();
d. pop_back ();
d. front ();
d . back ();
```

→ Sliding Window Maximum :-

K=3



brute force :

```
vector<int> ans;
for (i=0; i<n-K; i++)
{
    int total = INT_Min;
    for (j=i; j<i+K; j++)
    {
        total = max (total, nums[j]);
    }
    ans.push_back (total);
}
return ans;
```

(M2)

```
deque <int> d;
vector<int> ans;
for (i=0; i<K-1; i++)
{
    if(d.empty ())
        d.push_back (i);
    else
    {
        while(!d.empty && nums[i] > nums[d.back()])
            d.pop_back();
        d.push_back (i);
    }
}
for (i=K-1; i<n; i++)
{
    while(!d.empty && nums[i] > nums[d.back()])
        d.pop_back();
    d.push_back (i);
    if (d.front() <= i-K)
        d.pop_front();
    ans.push_back (nums[d.front()]);
}
return ans;
```

→ Minimum Number of K consecutive flip bits :-

→ all members should be '1'.

K=3 → flip = 0 K 2

K=2 → flip = 0 1 → return -1

can't convert all element in 1

brute force

T.C. = O(n K)

```
int flip = 0;
for (i=0; i<n; i++)
{
    if(nums[i] == 0)
    {
        for(j=i; j<=i+K-1; j++)
            nums[j] = (!nums[j]);
        flip++;
    }
}
return flip;
```

(if (i+K-1 >= n) return -1;)

flip = 1 2 3 3 2 1

1 → no. of flip odd = 0.
no of flip even = 1.

0 → no of flip odd = 1.
no of flip even = 0.

```
queue <int> q;
int flip = 0
for (i=0; i<n; i++)
{
    if(!q.empty && q.front()<i)
        q.pop();
    if (q.size()%2 == nums[i])
    {
        if(i+K-1 >= n)
            return -1;
        q.push(i+K-1);
        flip++;

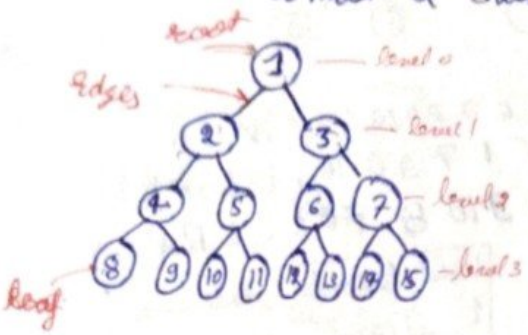
(q.size()%2 == nums[i])

Tree

- It is a type of Data structure that represent a hierarchial relationship between data elements called nodes.

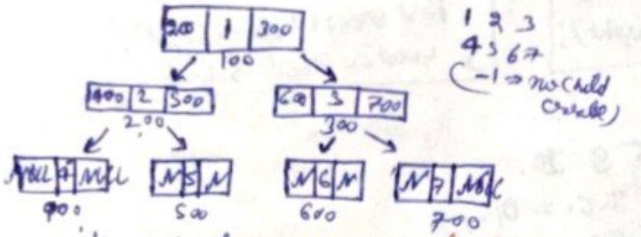
- Binary tree :- It is defined as a tree Data structure where each node has almost 2 children.



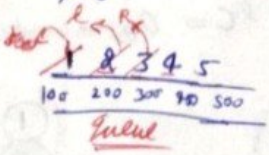
Node
Root
Parent
child
leaf
Ancestor

Descendent
level
Sibling
Height
Degree
Edges.

if n nodes → "(n-1) edges"



if x = -1, return NULL
① Create root node.
② left child.
③ Right child.

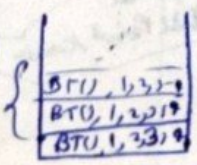


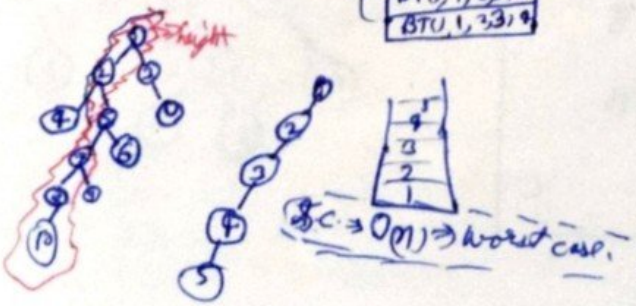
```
class Node
{
    Public :
    int data;
    Node * left, Node* Right;
    Node (int value)
    {
        data = value;
        left = Right = NULL;
    }
};
int main()
{
    int x ; first, second;
    cin >> x;
    queue <Node *> q; // store address.
    Node *root = new Node (x);
    q. push (root);
    while (! q.empty ())
    {
        Node * temp = q. front ();
        q. pop ();
        cin >> first; // left
        if (first != -1)
        {
            temp -> left = new Node (first);
            q. push (temp -> left);
        }
        cin >> second;
        if (second != -1)
        {
            temp -> Right = new Node (second)
            q. push (temp -> Right);
        }
    }
```

```
class Node
{
    // above class node same code
};
Node * Binary Tree ()
{
    int x;
    cin >> x;
    if ( x == -1)
        return NULL;
    Node *temp = new Node (x);
    temp -> left = Binary Tree (); // left side
    temp -> right = Binary Tree (); // Right side
    return temp;
}
```

T.C. ⇒ O(n)

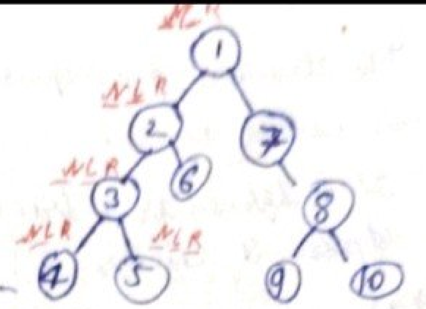
S.C. → Height of tree (O(h))





Traversal

① Pre-order Traversal (NLR)
② In-order Traversal (LNR)
③ Post-order Traversal (LRN)



Pre :- 1 2 3 4 5 6 7 8 9 10 (NLR)
In ⇒ 4 3 5 2 6 1 7 9 8 10. (LNR)
Post ⇒ 4 5 3 6 2 9 10 8 7 1 (LRN).

```
void Preorder(Node *root)
{
    if(root == NULL)
        return;
    cout<< root -> data;
    Preorder(root -> left);
    Preorder(root -> Right);
}
```

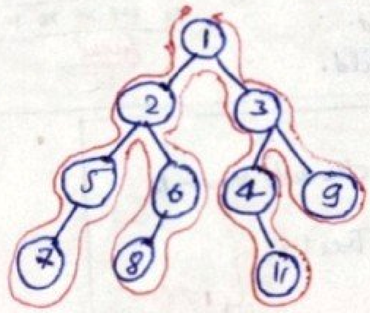
```
void Inorder(Node *root)
{
    if(root == NULL)
        return;
    Inorder(root -> left);
    cout<< root -> data;
    Inorder(root -> right);
}
```

```
void Postorder(Node *root)
{
    if(root == NULL)
        return;
    Postorder(root -> left);
    Post order(root -> Right);
    cout<< root -> data;
}
```

④ level-order Traversal (- 1 2 7 3 6 8 4 5 9 10.

```
vector <int> LevelOrder (Node *root)
{
    queue< Node *> q;
    q. push(root);
    vector<int> ans;
    Node * temp;
    while(! q empty())
    {
        temp = q.front();
        q. pop();
        ans.push_back(temp->data);
        if(temp -> left)
            q. push(temp->left);
        else
            q. push(temp -> Right);
    }
    return ans;
}
```

T.C. = O(n)
S.C ⇒ O(n) ⇒ worst case.



Pre-order: first time dekha to Print kara do.
1 2 5 7 6 8 3 4 11 9

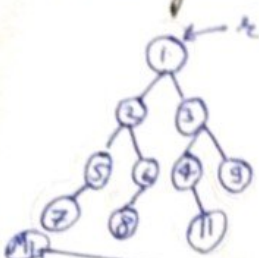
In Order: second time dekhne pe Print karo
7 5 2 8 6 1 4 11 3 9 1.

4 ko left se (-1) to 4 second time dekha

Post Order :- 3rd time visit pe Print karo
7 5 8 6 2 11 4 9 3 1.

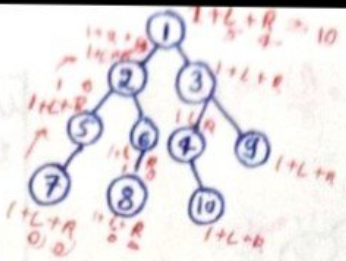
Jis node ke pass wapis kabhi nhi aa sakte usse Print karo

- Size of Binary tree :-



(M1)

```
void Total(Node *root, int& count)
{
    if(root == NULL)
        return;
    count++;
    Total(root->left, count);
    Total(root->right, count);
}
```



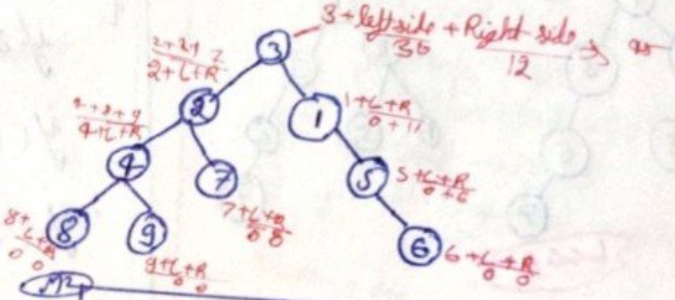
(M2)

```
int TotalNode (Node * root)
{
    if (root == NULL)
        return 0;
    return (1 + TotalNode(root->left) +
              Total Node(root->right));
}
```

- Sum of Binary Tree :-

(M1)

```
Void Total(Node*root, int& sum)
{
    if(root == NULL)
        return;
    sum += root->data;
    Total(root->left, sum);
    Total(root->right, sum);
}
```



(M2)

```
int Total(Node *root)
{
    if(root == NULL)
        return 0;
    return(root->data + Total(root->left)
              + Total(root->right));
}
```

→ Count leaves in Binary tree :-

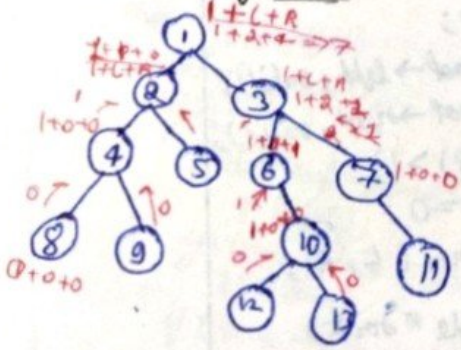
(M1)

```
void CountLeaf(Node*root, int& count)
{
    if(root == NULL)
        return;
    if(!root->left && !root->right)
    {
        count++;
        return;
    }
    CountLeaf(root->left, count);
    CountLeaf(root->right, count);
}
```

(M2)

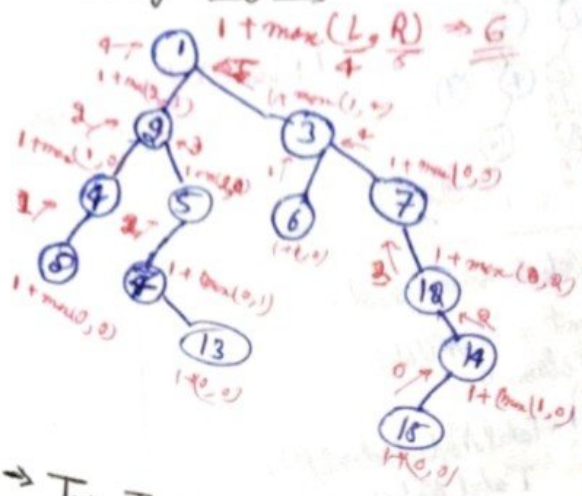
```
int Count leaf(Node*root)
{
    if(root == NULL)
        return 0;
    if(!root->left && !root->right)
        return 1;
    return(Count Leaf(root->left) +
              count Leaf(root->right));
}
```

→ Count Non leaf Nodes :-



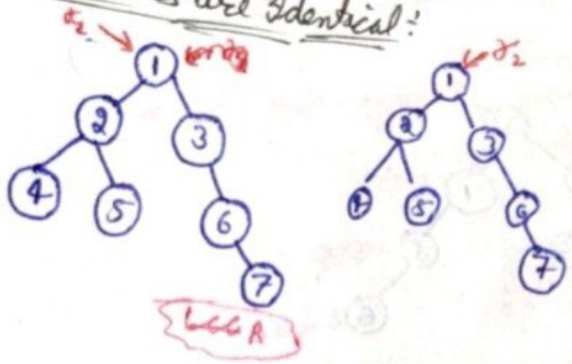
```
int NonLeaf(Node*root)
{
    if(root == NULL):
        return 0;
    if(!root->left && !root->right)
        return 0;
    return(1 + NonLeaf(root->left) +
              NonLeaf(root->right));
}
```

Height of Binary Tree



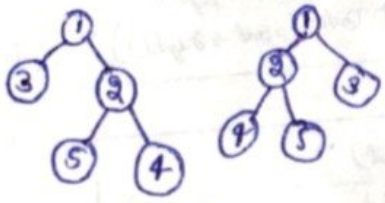
```
int height (Node *root)
{
    if (root == NULL)
        return 0;
    return (1 + max (height (root->left),
                     height (root->right));
}
```

→ Two Trees are Identical :-



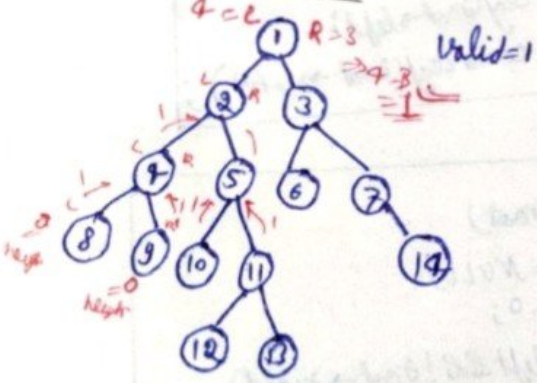
```
bool IsIdentical(Node* r1, Node *r2)
{
    if(r1==NULL && r2==NULL)
        return 1;
    if((!r1 && r2) || (r1 && !r2))
        return 0;
    if (r1->data != r2->data)
        return 0;
    return IsIdentical (r1->left, r2->left) &&
           IsIdentical (r2->right, r2->right);
}
```

→ Mirror Tree :-



```
void Mirror (Node *root)
{
    if(! root)
        return ;
    Node* temp = root->right;
    root->right = root->left;
    root->left = temp;
    Mirror (root->left);
}
    Mirror (root->Right);
```

→ Check for Balance Tree :-



cond* for balance

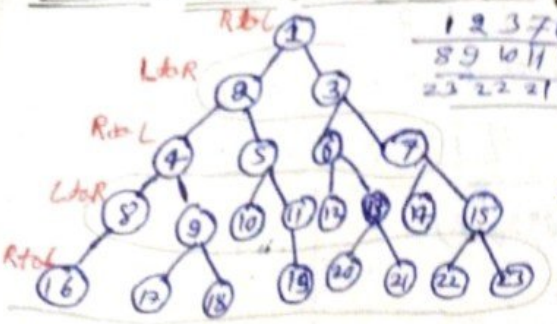
$-1 \le \text{height(left)} - \text{height(R)} \le 1$

(-1, 0, 1)

for each node

```
int height(Node* root, bool &valid)
{
    if (! root)
        return 0;
    int L = height (root->left, valid);
    int R = height (root->right, valid);
    if (abs(L - R) > 1)
        valid = 0;
    return 1 + max ( L, R);
}
bool Is balance (Node * root)
{
    bool valid = 1;
    Height (root, valid);
    return valid;
}
```

→ level order Traversal in spiral form :-



1 2 3 7 6 5 4
8 9 10 11 12 13 14 15
23 22 21 20 19 18 17 16

```
vector<int> Levelorder(Node *root)
{
    stack<Node*> S1;  // R to L
    stack<Node*> S2;  // L to R.
    S1.push(root);
    vector<int> ans;
    while(!S1.empty() || !S2.empty())
    {
        if(!S1.empty())  // R to L
        {

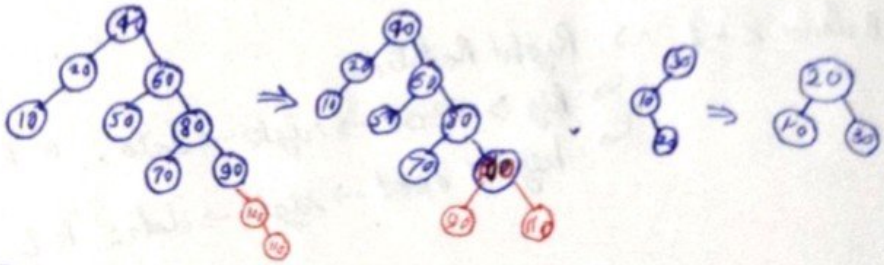
AVL Tree – Self Balance Binary Search Tree

BST ⇒ T.C.
Insertion : O(n).
Search : O(n).
Deletion : O(n)
creation : → Online Array : nlogn
→ Runtime : n²

Balance BST ⇒ $-1 \le h(LST) - h(RST) \le 1$

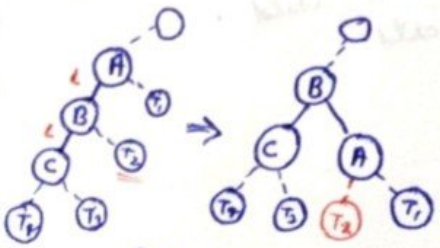


Left Rotation Right Rotation.

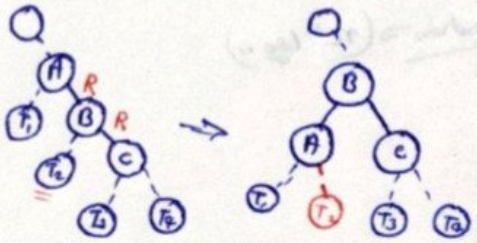
"Left rotate Top".
"Right Rotate Top"
"Left Right Rotate Middle"
"Right Rotate Top"
"Right Rotate Middle"
"Left Rotate Top".

① LL case : Right Rotation (Top).
② RR case : Left Rotation (Top).
③ LR Case : Left Rotation (Middle), Right Rotation (Top).
④ RL case : Right Rotation (Middle), Left Rotate (Top).

⊛ Edge cases.



Right Rotation
B → Right child → A → left child



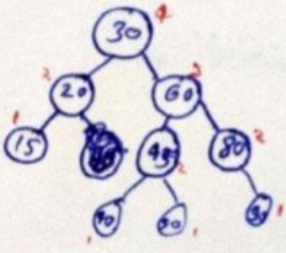
Left Rotation
B → left child ⇒ A → Right child.

⊛ Examples:

Balance > 1 ⇒ left side
Balance < -1 ⇒ Right side

→ h(LST) - h(RST)
3 - 1 ⇒ 2 > 1
left side

⇒



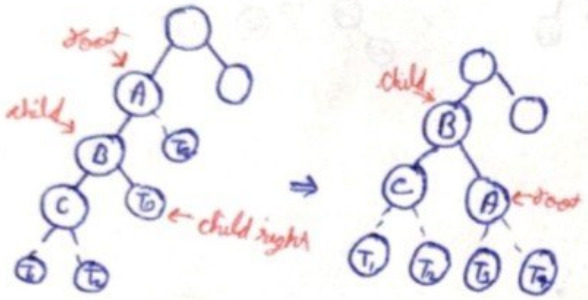
Node
→ data
→ left
→ Right
→ height.

height = 1 + max(L, R)

Balance > 1 ⇒ left Rotation
- key < root → left → data : L L.
- key > root → left → data : L R.

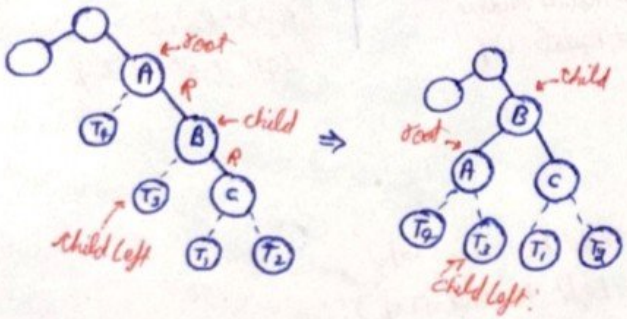
Balance < -1 ⇒ Right Rotation
- key > root → right → data : R R.
- key < root → right → data : R L.

→ Right Rotate



① child = root → left.
② childRight = child → right.
③ child → right = root.
④ root → left = childRight.
⑤ update root height.
⑥ update child height.
return child.

→ Left Rotation



① child = root → right.
② child Left = child → left.
③ child → left = root;
④ root → right = child Left;
⑤ update height - root
child.
return child.

T.C. → one rotation → $(n * \log n)$

STL

→ Pair :

Pair < Type 1, Type 2 > name_of_pair ;

Rohit, 30 → Pair < string, int > P ;

① P = make_pair ("Rohit", 30);

② P.first = "Rohit";
P.second = 30;

⇒ Pair < string, Pair < int, int > > P ;

① P = make_pair ("Harsh", make_pair (19, 64));

② P.first = "Harsh";
~~P.first~~ P.second.first = 19;
P.second.second = 64;

→ list : — (Doubly linked list):

list < Type > name_of_list ;

list < int > l1 ;

l1.push_back (30);
l2.push_back (50);
l1.push_front (70);

① push_back();
② push_front();

③ Pop_front();
④ Pop_back();

⑤ front();
⑥ back();
⑦ l1.size();
⑧ l1.empty();

70 ⇄ 30 ⇄ 50

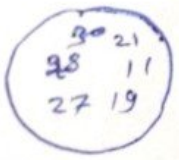
// iterator.

```
for (auto it = l.begin(); it != l.end(); it++)
{
    cout << *it << " ";
}
```

→ Set :

① It stores only unique element.
② It stores value in sorted order.

search, insert, delete
↳ log(n) ⇒ Time.



↳ AVL Tree

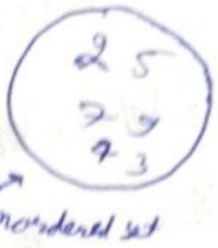
set < int > s ;

s.insert (20);
s.

- Multiset ⇒ could store non unique elements

→ Unordered Set : → implement by Hashing

- it store unique element.
- it store data in unordered way



unordered set

① Search, insert, delete → O(1).

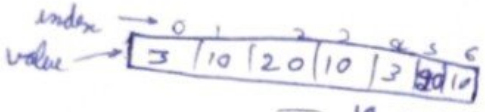
→ Map :-

Key – value

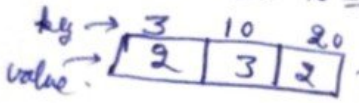
unique duplicate.

→ Sorted form on basis of Key.

→ Search, Insert, Delete → log(n)



= 10 ⇒ 3 times → O(n)



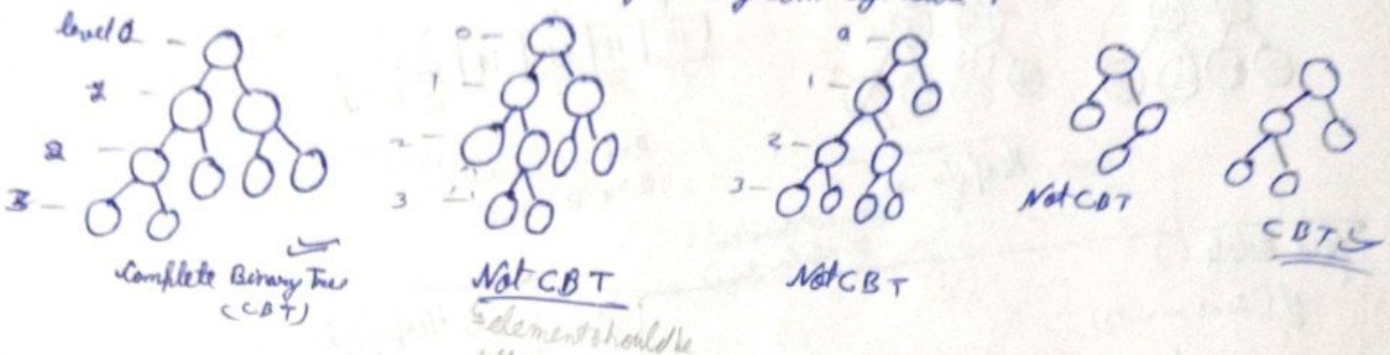
→ O(log n).

Password check

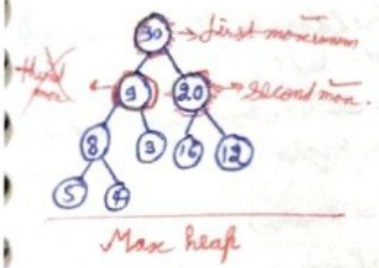
cout << m[10];

Heap

↳ It is a complete Binary Tree.
↳ All level are completely filled except the last level.
↳ At last level, nodes should be filled from left side.

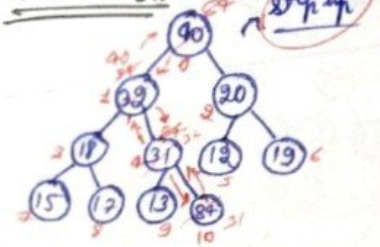


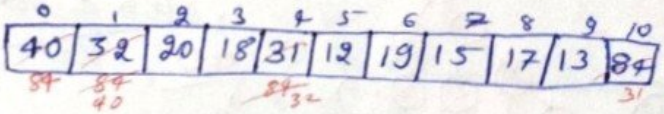
- Max heap :- ↳ CBT
  ↳ Parent node should be greater than or equal to child node.
  ↳ for all Node it should be valid.
- Min heap :- ↳ CBT
  ↳ Parent node should be less than or equal to it's child node.
  ↳ it should be valid for each node.



- Build max heap
  ① find the node where, the new node will be inserted → O(n)
  ② Maintain the heap properly (swap the nodes).

→ Insertion





T.C. → log n.

Parent_index - i
↳ 2*i + 1 (left child)
↳ 2*i + 2 (Right Child)

Child_index - i
↳ Parent: (i - 1)/2.

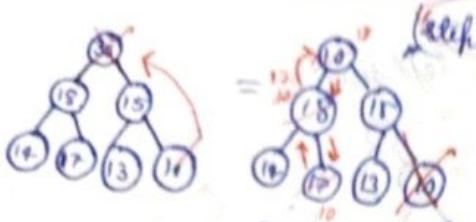
↳ T.C. (worst case) ⇒ n log n

```
class MaxHeap
{
    int *arr;
    int size; // Total element in heap
    int TotalSize; // Total element in array
    MaxHeap(int n) // n is size of array
    {
        arr = new int[n];
        size = 0;
        total_size = n;
    }
```

```
// insert into heap.
void insert(int value)
{
    if(size == TotalSize)
    {
        cout<< "Heap Overflow";
        return;
    }
    arr[size] = value;
    int index = size;
    size++;
    while(index > 0 && arr[(index-1)/2] < arr[index])
    {
        swap(arr[index], arr[(index-1)/2]);
        index = (index-1)/2;
    }
};
```

→ Delete in Heap :

Max heap → Delete → Top node → T.C. → O(log n)



0	1	2	3	4	5
10	18	15	14	17	13

⇒

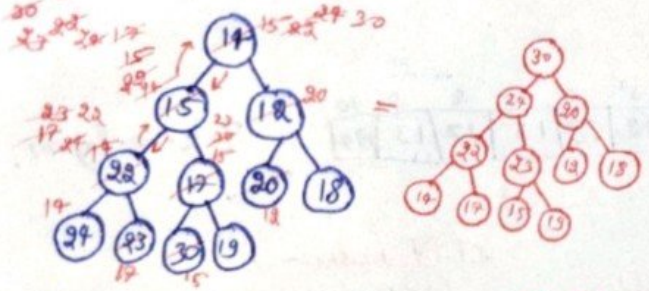
2×i + 1 = L.C.
2×i + 2 = R.C.

Remember - Heapify → (correct position Bi chala jaaa)

```
void Delete()
{
  if(size == 0)
  {
    cout << "Heap Overflow \n";
  }
  return;
  cout << arr[0] << " is deleted from heap";
  arr[0] = arr[size-1];
  size--;
  if(size == 0)
    return;
  Heapify(0); //
}
```

```
// Heapify function.
void Heapify(int index)
{
  int largest = index;
  int left = 2*index+1;
  int right = 2*index+2;
  // largest will be replaced by the index
     having greatest value among
     parent, left and right;
  if(left < size && arr[left] > arr[largest])
     largest = left;
  if(right < size && arr[right] > arr[largest])
     left = right;
  if(largest != index)
  {
    swap(arr[index], arr[largest]);
    Heapify(largest);
  }
}
```

→ Build Heap (Slip up)



child = i
Parent = $\frac{i-1}{2}$

0	1	2	3	4	5	6	7	8	9	10
14	15	12	23	17	20	18	24	23	30	19

→ T.C. → (n log n)

(height → $\log_2 n$)

$\Rightarrow \frac{n}{2}\log n + \frac{n}{4}(\log n - 1) + \frac{n}{8}(\log n - 2) + \cdots + 1$

$\frac{n}{2}\log n + \frac{n}{4}\log n - \frac{n}{8}\log n + \cdots - \left(\frac{1}{4} + \frac{2}{8} + \frac{3}{16} + \cdots\right)$

$n\log n\left(\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots \text{upto } \log n\right) - n\left(\frac{1}{4} + \frac{2}{8} + \frac{3}{16} + \cdots\right)$

GP = $\frac{a}{(1-r)}$

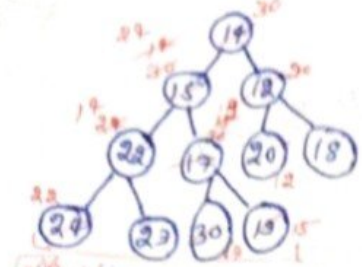
$n\log n\,(1) - n\,(A') \Rightarrow n\log n$

Heapify down

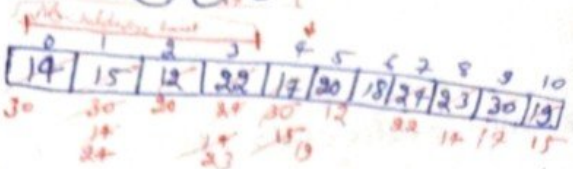
Parent = i

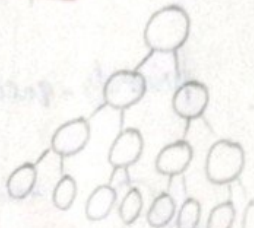
Left child = 2*i + 1;

Right child = 2*i + 2;



T.C. = O(n) ?

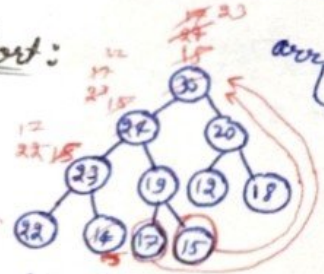




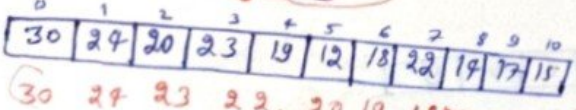
```
void Heapify(int arr[], int index, int n)
{
    int largest = index;
    int left = 2*index + 1;
    int Right = 2*index + 2;
    if (left < n && arr[left] > arr[largest])
        largest = left;
    if (right < n && arr[right] > arr[largest])
        largest = right;
    if (largest != index)
    {
        swap(arr[index], arr[largest]);
        Heapify(arr, largest, n);
    }
}
void BuildMaxHeap(arr[], int n)
{
    for(i = n/2 - 1; i >= 0; i--)
        Heapify(arr, i, n);
}
```

→ Heapify : T.C. ⇒ O(n)

→ Heap Sort :



arr → Max_heap O(n)

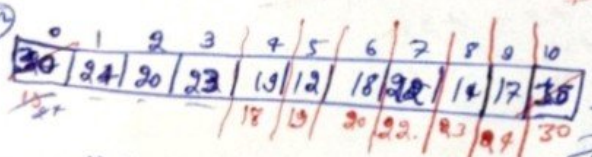


30 24 23 22 20 19 18 17 15 14 17 ⇒ S.C = O(n)

(M1)

① Top element ko Bahar nikalo.
② Top element replace by last level right most node
③ replace nodes to make Max_heap.

(M2)



⇒ S.C ⇒ O(1)

T.C. ⇒ O(n log n)

(M2)

① Replace first element with last element
② Decrease size by 1
③ Apply heapify.

// Max heap ka array ko Min Sort.

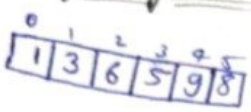
```
void sortArray(int arr[], int n)
{
    for(int i = n-1; i > 0; i--)
    {
        swap(arr[i], arr[0]);
        Heapify(arr, 0, i);
    }
}
```

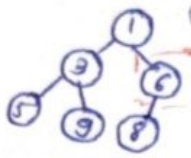
→ Priority Queue : → it is type of STL.
Part

priority_queue < int > P; //(Max heap)
P.pop();
P.top();
P.size();

priority_queue <int, vector<int>, greater<int> > P; //(Min Heap).

→ Height of a heap :

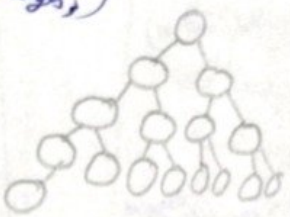




(Return no. of edges;)
edge

if height = 1 return 1

```
int heapHeight (int N, int arr[])
{
    if (N == 1)
        return 1;
    int height = 0;
    while (N > 1)
    {
        height ++;
        N /= 2;
    }
    return height;
}
```



Nodes — Height (no. of edges)
1 — 0
2 — 1
3 — 1
4 — 2
5 — 2
6 — 2
7 — 2
8 — 3
9 — 3
15 — 3
16 — 4

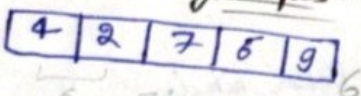
$\log_2 N$ = Height

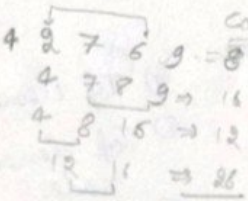
$2^{Height} = N$

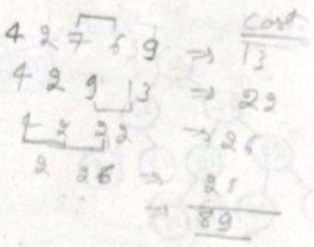
$2^{height} = 4 \Rightarrow 4$

T.C. = log N

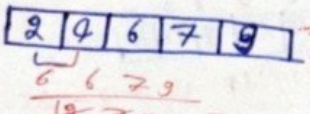
→ Minimum cost of Ropes :⇒







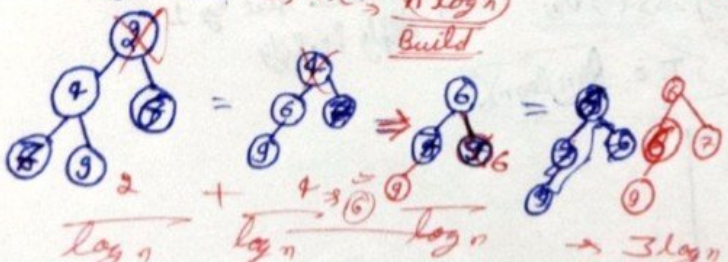
- Select 2 smallest nodes. → 'Sort the Array'
(n log n)



Sch down
O(n²)

6 6 7 9
12 7 9 → 7 9 12
16 12 → 12 16
28.

M2 ⇒ Make priority Queue ⇒ T.C → (n log n)
Build



→ 3 log n

⇒ (n-1) log n
→ (n log n) ⇒ T.C.

```
int minCost(int arr[], int n)
{
    priority_queue<int, vector<int>, greater<int>> P;
    for(int i=0; i<n; i++)
        P.push(arr[i]);
    int cost = 0;
    while(P.size()>1)
    {
        int rope = P.top();
        P.pop();
        rope += P.top();
        P.pop();
        cost += rope;
        P.push(rope);
    }
    return cost;
}
```

→ Magician & chocolates :-

2	4	8	6	10

A=5 arr

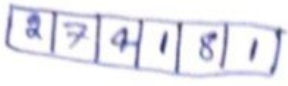
2 4 8 3 10
2 4 8 3 5
2 4 8 3 2
2 2 8 3 2
2 1 8 3 2

eat max chocolate.
if I eat a bag's chocklet it filled half of original chocklet chocolate again.

27

Delete + insert = heap

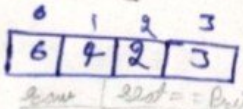
→ Last Stone Weight :-



```
int lastStoneWeight(vector<int>& stones)
{
    priority_queue<int> P;
    for(int i=0; i<stone.size(); i++)
    P.push(stone[i]);
    while(P.size()>1)
    {
        int weight = P.top();
        P.pop();
        weight -= P.top();
        P.pop();
        if(weight)
        P.push(weight);
    }
    return P.empty();
}
```

→ Take gift from Richest Pile :-

→ Profit Maximization :-



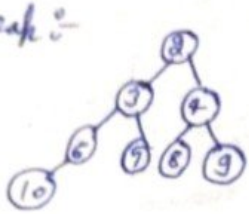
→ K^{th} Smallest Element

K = 4

10	3	7	4	8	9	2	6

① Sort → 2 3 4 6 7 8 9 10 ∴ (T.C. → n log n, S.C. → O(1)).

② Min_heap :-



T.C. → [O(n) + K log n] → (n log n) W.C.
S.C. → 1

③

0	1	2	3	4	5	6	7
10	3	7	4	8	9	2	6

Smallest Element → Max heap
Largest Element → Min heap.

Max heap → O(K) + O(K log K) → O(K) ⇒ Helps

n − K times

(n − k) * 2 log K + K → n log K (W.C.)

```
int KthSmallest(int arr[], int n, int K)   // (SIZE(arr)-1)
{
    // int n = arr.size() - 1;

8	6

dP

length of array → (n+1) (6+1=7)

```
int fibo(int n, vector<int>& dp)
{
    if (n <= 1)
        return n;
    if (dp[n] != -1)
        return dp[n];
    return dp[n] = fib(n-1, dp) + fib(n-2, dp);
}
```

T.C = O(n)

S.C → O(n) (array) + O(n) (rec. stack)

→ Bottom up: Base case → upper.

dP: 0 1 2 3 4 5

```
for (i = 2; i <= n; i++)
{
    dp[i] = dp[i-1] + dp[i-2];
}
```

① base case fill karo.

② function ka dp mein main concept kaha (Array).

⇒ T.C → O(n).
S.C → O(n) (dp array)

→ Space optimization:

dP: 0 1 1 2 3 5 8 13 21 34

0 1 1 / 1 1 2 / 1 2 3 ...

Prev2 Prev Curr

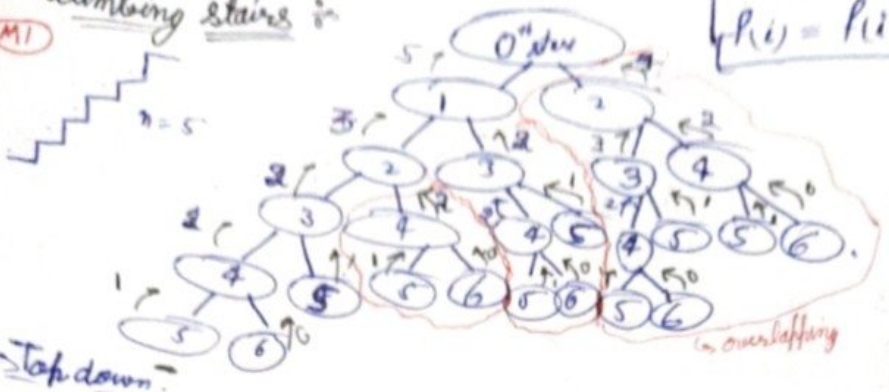
```
for (int i = 2; i <= n; i++)
{
    curr = prev1 + prev2;
    prev2 = prev1;
    prev1 = curr;
}
return curr;
```

T.C = O(n)

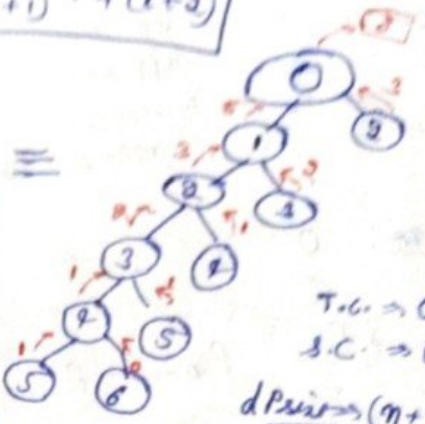
S.C → O(1)

Climbing stairs :-

M1



$$f(i) = f(i+1) + f(i+2)$$



T.C. → O(n)
S.C. → O(n) + O(n)

dP size → (n+2)

vector<int> dP(n+2, -1)

→ Top down :-

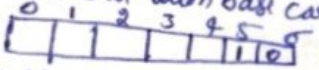
```
int count (int i, int n)
{
    if(i == n)
        return 1;
    if(i > n)
        return 0;
    if(dP[i] != -1)
        return dP[i];
    return dP[i] = count(i+1, n) + count(i+2, n);
}
```

→ TC → O(n)
→ S.C → O(n) + O(n)
dP Recursive tree.

→ Bottom up

① vector<int> dP(n+2, -1)

② Initialize it with base case.

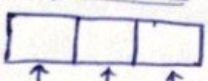


③ fill the remaining dP (reverse order of Top down)

```
for(i = n-1; i >= 0; i--)
{
    dP[i] = dP[i+1] + dP[i+2];
}
return dP[0];
```

→ TC = O(n)
→ S.C → O(n)

→ Space optimization



```
curr, next1 = 1, next2 = 0
for(i = 0; i >= 0; i--)
{
    curr = next1 + next2;
    next2 = next1;
    next1 = curr;
}
return curr;
```

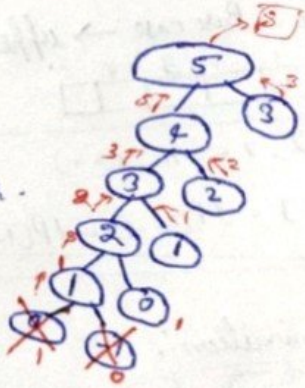
→ TC → O(n)
→ S.C → O(1)

M2

f(i) = f(i-1) + f(i-2)

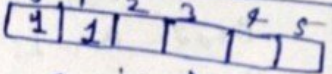
① Total no. of ways to go from 0th stair to 5th stair.
(nth)

② Total no of ways to reach 5th stair from 0th stair.



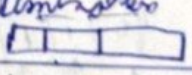
```
int count(int i, vector<int> dP)
{
    if(i <= 1)
        return 1;
    if(dP[i] != -1)
        return dP[i];
    return dP[i] = count(i-1, dP) + count(i-2, dP);
}
```

→ Bottom down :-



```
for(i = 2; i <= n; i++)
{
    dP[i] = dP[i-1] + dP[i-2];
}
return dP[n];
```

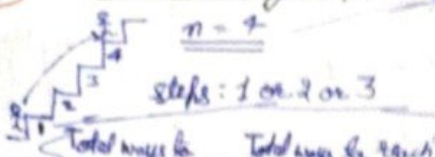
→ Space optimization



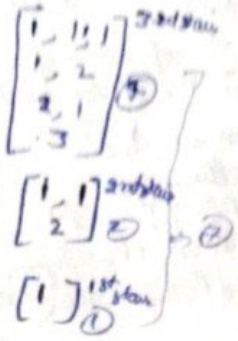
```
for(i = 2; i <= n; i++)
{
    curr = prev1 + prev2;
    prev2 = prev1;
    prev1 = curr;
}
return curr;
```

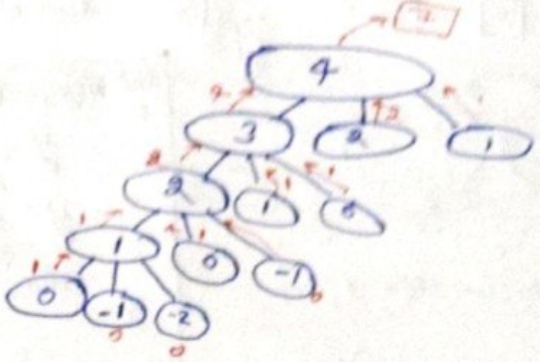
→ TC → O(n)
→ S.C → O(1)

Q1 Count number of hops: → {(2,2), (2,1,1), (1,1,2), (1,2,1), (1,1,1,1), (2,1,1), (1,2,1), (1,1,2)} → 7 ways.



Total ways to reach nth stair = Total ways to reach n-1 stair + Total ways to reach n-2 stair + Total ways to reach n-3 stair.





① Recursion

```
int ways(int n)
{
  if(n==0)
    return 1;
  if(n<0)
    return 0;
  return ways(n-1)+ways(n-2)
         + ways(n-3);
}
```

→ Top down. ⇒ vector<int> dP(n+1, -1)

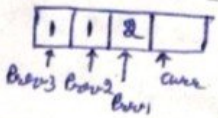
```
int ways(int n, vector<int> dP)
{
  if(n<=1)
    return 1;
  if(n==2)
    return 2;
  if(dP[n] != -1)
    return dP[n];
  return dP[n] = ways(n-1,dP)+ways(n-2,dP) + ways(n-3,dP);
}
```

↳ T.C. = O(n)
S.C. ⇒ O(n) + O(n).

→ Bottom up: ⇒ 0 → 4

```
for(i=3; i<=n; i++)          → O(n)
{
  dP[i] = dP[i-1]+dP[i-2]+   → O(n)
          dP[i-3];
}
return dP[n];
```

→ Space optimization



```
for(i=3; i<=n; i++)
{
  curr = Prev1 + Prev2 + Prev3;
  Prev3 = Prev2;
  Prev2 = Prev1;
  Prev1 = curr;
}
```

→ T.C ⇒ O(n)
→ S.C ⇒ O(1)

Q2 0th → nth stair
